MS19-NOV: Microsoft Windows Security Update High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their November 2019 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2019-1234 - Azure Stack Spoofing Vulnerability
CVE-2019-1374 - Windows Error Reporting Information Disclosure Vulnerability
CVE-2019-1415 - Windows Installer Elevation of Privilege Vulnerability
CVE-2019-1416 - Windows Subsystem for Linux Elevation of Privilege Vulnerability
CVE-2019-1417 - Windows Data Sharing Service Elevation of Privilege Vulnerability
CVE-2019-1418 - Windows Modules Installer Service Information Disclosure Vulnerability
CVE-2019-1430 - Microsoft Windows Media Foundation Remote Code Execution Vulnerability
CVE-2019-1432 - DirectWrite Information Disclosure Vulnerability
CVE-2019-1433 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2019-1434 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1435 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2019-1436 - Win32k Information Disclosure Vulnerability
CVE-2019-1437 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2019-1438 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2019-1439 - Windows GDI Information Disclosure Vulnerability
CVE-2019-1440 - Win32k Information Disclosure Vulnerability
CVE-2019-1441 - Win32k Graphics Remote Code Execution Vulnerability
CVE-2019-11135 - Windows Kernel Information Disclosure Vulnerability
CVE-2019-1456 - OpenType Font Parsing Remote Code Execution Vulnerability
CVE-2018-12207 - Windows Denial of Service Vulnerability
ADV190024 - Microsoft Guidance for Vulnerability in Trusted Platform Module (TPM)
ADV990001 - Latest Servicing Stack Updates
CVE-2019-0712 - Windows Hyper-V Denial of Service Vulnerability
CVE-2019-0719 - Hyper-V Remote Code Execution Vulnerability
CVE-2019-0721 - Hyper-V Remote Code Execution Vulnerability
CVE-2019-1309 - Windows Hyper-V Denial of Service Vulnerability
CVE-2019-1310 - Windows Hyper-V Denial of Service Vulnerability
CVE-2019-1324 - Windows TCP/IP Information Disclosure Vulnerability
CVE-2019-1370 - Open Enclave SDK Information Disclosure Vulnerability
CVE-2019-1379 - Windows Data Sharing Service Elevation of Privilege Vulnerability
CVE-2019-1380 - Microsoft splwow64 Elevation of Privilege Vulnerability
CVE-2019-1381 - Microsoft Windows Information Disclosure Vulnerability
CVE-2019-1382 - Microsoft ActiveX Installer Service Elevation of Privilege Vulnerability
CVE-2019-1383 - Windows Data Sharing Service Elevation of Privilege Vulnerability
CVE-2019-1384 - Microsoft Windows Security Feature Bypass Vulnerability

CVE-2019-1385 - Windows AppX Deployment Extensions Elevation of Privilege Vulnerability
CVE-2019-1388 - Windows Certificate Dialog Elevation of Privilege Vulnerability
CVE-2019-1389 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2019-1391 - Windows Denial of Service Vulnerability
CVE-2019-1392 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2019-1393 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1394 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1395 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1396 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1397 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2019-1398 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2019-1399 - Windows Hyper-V Denial of Service Vulnerability
CVE-2019-1405 - Windows UPnP Service Elevation of Privilege Vulnerability
CVE-2019-1406 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1407 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2019-1408 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1409 - Windows Remote Procedure Call Information Disclosure Vulnerability
CVE-2019-1411 - DirectWrite Information Disclosure Vulnerability
CVE-2019-1412 - OpenType Font Driver Information Disclosure Vulnerability
CVE-2019-1419 - OpenType Font Parsing Remote Code Execution Vulnerability
CVE-2019-1420 - Windows Elevation of Privilege Vulnerability
CVE-2019-1422 - Windows Elevation of Privilege Vulnerability
CVE-2019-1423 - Windows Elevation of Privilege Vulnerability
CVE-2019-1424 - NetLogon Security Feature Bypass Vulnerability
CVE-2019-1425 - Visual Studio Elevation of Privilege Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.3
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2012
Windows Server 2019
Microsoft Visual Studio 2019 version 16.0
Open Enclave SDK
Windows 7 for x64-based Systems Service Pack 1
Windows 10 Version 1803 for x64-based Systems
Azure Stack
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows 10 Version 1709 for x64-based Systems
Microsoft Visual Studio 2017 version 15.9
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems

Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows 10 Version 1903 for 32-bit Systems
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 1903 for x64-based Systems
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows 10 Version 1709 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1709 for ARM64-based Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows Server, version 1803 (Server Core Installation)
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 Version 1803 for ARM64-based Systems
Windows 10 Version 1903 for ARM64-based Systems
None affected
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

CVSS Base Score: 9.9

MS19-OCT: Microsoft Internet Explorer Security Update High

Solution Details

Microsoft has released a fix for this flaw in their October 2019 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2019-0608 - Microsoft Browser Spoofing Vulnerability
CVE-2019-1371 - Internet Explorer Memory Corruption Vulnerability
CVE-2019-1238 - VBScript Remote Code Execution Vulnerability
CVE-2019-1239 - VBScript Remote Code Execution Vulnerability
CVE-2019-1357 - Microsoft Browser Spoofing Vulnerability

Affected Products:
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1703 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1703 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems

Internet Explorer 10 on Windows Server 2012
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows RT 8.1
Microsoft Edge (EdgeHTML-based) on Windows 10 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1703 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1703 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2012
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for x64-based Systems

CVSS Base Score: 7.5

MS19-OCT: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their October 2019 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2019-1060 - MS XML Remote Code Execution Vulnerability

CVE-2019-1341 - Windows Power Service Elevation of Privilege Vulnerability
CVE-2019-1342 - Windows Error Reporting Manager Elevation of Privilege Vulnerability
CVE-2019-1343 - Windows Denial of Service Vulnerability
CVE-2019-1344 - Windows Code Integrity Module Information Disclosure Vulnerability
CVE-2019-1345 - Windows Kernel Information Disclosure Vulnerability
CVE-2019-1346 - Windows Denial of Service Vulnerability
CVE-2019-1347 - Windows Denial of Service Vulnerability
CVE-2019-1375 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
ADV990001 - Latest Servicing Stack Updates
CVE-2019-1166 - Windows NTLM Tampering Vulnerability
CVE-2019-1230 - Hyper-V Information Disclosure Vulnerability
CVE-2019-1311 - Windows Imaging API Remote Code Execution Vulnerability
CVE-2019-1313 - SQL Server Management Studio Information Disclosure Vulnerability
CVE-2019-1314 - Windows 10 Mobile Security Feature Bypass Vulnerability
CVE-2019-1315 - Windows Error Reporting Manager Elevation of Privilege Vulnerability
CVE-2019-1316 - Microsoft Windows Setup Elevation of Privilege Vulnerability
CVE-2019-1317 - Microsoft Windows Denial of Service Vulnerability
CVE-2019-1318 - Microsoft Windows Transport Layer Security Spoofing Vulnerability
CVE-2019-1319 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2019-1320 - Microsoft Windows Elevation of Privilege Vulnerability
CVE-2019-1321 - Microsoft Windows CloudStore Elevation of Privilege Vulnerability
CVE-2019-1322 - Microsoft Windows Elevation of Privilege Vulnerability
CVE-2019-1323 - Microsoft Windows Update Client Elevation of Privilege Vulnerability
CVE-2019-1325 - Windows Redirected Drive Buffering System Elevation of Privilege Vulnerability
CVE-2019-1326 - Windows Remote Desktop Protocol (RDP) Denial of Service Vulnerability
CVE-2019-1333 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2019-1334 - Windows Kernel Information Disclosure Vulnerability
CVE-2019-1336 - Microsoft Windows Update Client Elevation of Privilege Vulnerability
CVE-2019-1337 - Windows Update Client Information Disclosure Vulnerability
CVE-2019-1338 - Windows NTLM Security Feature Bypass Vulnerability
CVE-2019-1339 - Windows Error Reporting Manager Elevation of Privilege Vulnerability
CVE-2019-1340 - Microsoft Windows Elevation of Privilege Vulnerability
CVE-2019-1358 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1359 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1361 - Microsoft Graphics Components Information Disclosure Vulnerability
CVE-2019-1362 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1363 - Windows GDI Information Disclosure Vulnerability
CVE-2019-1364 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1365 - Microsoft IIS Server Elevation of Privilege Vulnerability
CVE-2019-1368 - Windows Secure Boot Security Feature Bypass Vulnerability
CVE-2019-1369 - Open Enclave SDK Information Disclosure Vulnerability
CVE-2019-1372 - Azure App Service Remote Code Execution Vulnerability
CVE-2019-1376 - SQL Server Management Studio Information Disclosure Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems

Windows Server, version 1903 (Server Core installation)
Azure App Service on Azure Stack
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2019
Windows Server 2012
Open Enclave SDK
Windows 7 for x64-based Systems Service Pack 1
Windows 10 Version 1803 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows 10 Version 1703 for x64-based Systems
Windows 10 Version 1709 for x64-based Systems
Windows Server 2012 R2 (Server Core installation)
Windows 8.1 for x64-based systems
Windows Server 2012 R2
SQL Server Management Studio 18.3
Windows 8.1 for 32-bit systems
Windows 10 Mobile
Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows 10 Version 1903 for 32-bit Systems
Microsoft Dynamics 365 (on-premises) version 9.0
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1903 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows 10 Version 1709 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1709 for ARM64-based Systems
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Windows Server, version 1803 (Server Core Installation)
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 Version 1703 for 32-bit Systems
Windows 10 for x64-based Systems
Windows 10 Version 1803 for ARM64-based Systems
Windows 10 Version 1903 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
SQL Server Management Studio 18.3.1

MS19-SEP: Microsoft Internet Explorer Out-of-Band Security Update — High

Vulnerability Details

Microsoft has released an out-of-band security update for Internet Explorer which includes a fix for the following vulnerability:

CVE-2019-1367 - Scripting Engine Memory Corruption Vulnerability

Affected Products:
Internet Explorer 9 on Windows Server 2008 for x64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems
Internet Explorer 10 on Windows Server 2012 for x64-based Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems

Internet Explorer 11 on Windows Server 2008 R2 for 32-bit Systems
Internet Explorer 11 on Windows 7 for x64-based Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows RT 8.1 for x64-based systems
Internet Explorer 11 on Windows RT 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2 for x64-based Systems
Internet Explorer 11 on Windows Server 2012 R2 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1507 for x64-based Systems

MS19-SEP: Microsoft Internet Explorer Security Update High

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2019-1208 - VBScript Remote Code Execution Vulnerability
CVE-2019-1220 - Microsoft Browser Security Feature Bypass Vulnerability
CVE-2019-1221 - Scripting Engine Memory Corruption Vulnerability
CVE-2019-1236 - VBScript Remote Code Execution Vulnerability

Affected Products:
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1703 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1703 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems

Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 10 on Windows Server 2012
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows RT 8.1
Microsoft Edge (EdgeHTML-based) on Windows 10 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1703 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1703 for 32-bit Systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows Server 2012
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for x64-based Systems

MS19-SEP: Microsoft Windows Security Update — High

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2019-0928 - Windows Hyper-V Denial of Service Vulnerability
CVE-2019-1209 - Lync 2013 Information Disclosure Vulnerability

CVE-2019-1214 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2019-1215 - Windows Elevation of Privilege Vulnerability
CVE-2019-1216 - DirectX Information Disclosure Vulnerability
CVE-2019-1219 - Windows Transaction Manager Information Disclosure Vulnerability
CVE-2019-1231 - Rome SDK Information Disclosure Vulnerability
CVE-2019-1232 - Diagnostics Hub Standard Collector Service Elevation of Privilege Vulnerability
CVE-2019-1267 - Microsoft Compatibility Appraiser Elevation of Privilege Vulnerability
CVE-2019-1268 - Winlogon Elevation of Privilege Vulnerability
CVE-2019-1269 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2019-1270 - Microsoft Windows Store Installer Elevation of Privilege Vulnerability
CVE-2019-1271 - Windows Media Elevation of Privilege Vulnerability
CVE-2019-1272 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2019-1273 - Active Directory Federation Services XSS Vulnerability
CVE-2019-1274 - Windows Kernel Information Disclosure Vulnerability
ADV990001 - Latest Servicing Stack Updates
CVE-2019-0787 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2019-0788 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2019-1235 - Windows Text Service Framework Elevation of Privilege Vulnerability
CVE-2019-1240 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1241 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1242 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1243 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1244 - DirectWrite Information Disclosure Vulnerability
CVE-2019-1245 - DirectWrite Information Disclosure Vulnerability
CVE-2019-1247 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1248 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1249 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1250 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2019-1251 - DirectWrite Information Disclosure Vulnerability
CVE-2019-1252 - Windows GDI Information Disclosure Vulnerability
CVE-2019-1253 - Windows Elevation of Privilege Vulnerability
CVE-2019-1254 - Windows Hyper-V Information Disclosure Vulnerability
CVE-2019-1256 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1265 - Microsoft Yammer Security Feature Bypass Vulnerability
CVE-2019-1277 - Windows Audio Service Elevation of Privilege Vulnerability
CVE-2019-1278 - Windows Elevation of Privilege Vulnerability
CVE-2019-1280 - LNK Remote Code Execution Vulnerability
CVE-2019-1282 - Windows Common Log File System Driver Information Disclosure Vulnerability
CVE-2019-1283 - Microsoft Graphics Components Information Disclosure Vulnerability
CVE-2019-1284 - DirectX Elevation of Privilege Vulnerability
CVE-2019-1285 - Win32k Elevation of Privilege Vulnerability
CVE-2019-1286 - Windows GDI Information Disclosure Vulnerability
CVE-2019-1287 - Windows Network Connectivity Assistant Elevation of Privilege Vulnerability
CVE-2019-1289 - Windows Update Delivery Optimization Elevation of Privilege Vulnerability
CVE-2019-1290 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2019-1291 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2019-1292 - Windows Denial of Service Vulnerability
CVE-2019-1293 - Windows SMB Client Driver Information Disclosure Vulnerability
CVE-2019-1294 - Windows Secure Boot Security Feature Bypass Vulnerability

CVE-2019-1301 - .NET Core Denial of Service Vulnerability
CVE-2019-1302 - ASP.NET Core Elevation Of Privilege Vulnerability
CVE-2019-1303 - Windows Elevation of Privilege Vulnerability
CVE-2019-1305 - Team Foundation Server Cross-site Scripting Vulnerability
CVE-2019-1306 - Azure DevOps and Team Foundation Server Remote Code Execution Vulnerability

Affected Products:
ASP.NET Core 2.1
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
ASP.NET Core 3.0
Windows 10 Version 1607 for 32-bit Systems
Rome SDK 1.4.1
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2019
Windows Server 2012
ASP.NET Core 2.2
Microsoft Visual Studio 2019 version 16.0
Windows 7 for x64-based Systems Service Pack 1
Windows 10 Version 1803 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows 10 Version 1703 for x64-based Systems
Microsoft Lync Server 2013
Windows Server 2012 R2 (Server Core installation)
Windows 10 Version 1709 for x64-based Systems
Microsoft Visual Studio 2017 version 15.9
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Azure DevOps Server 2019 Update 1
Team Foundation Server 2017 Update 3.1
Windows 10 Version 1903 for 32-bit Systems
Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Microsoft Visual Studio 2019 version 16.2
Team Foundation Server 2018 Update 3.2
.NET Core 2.1
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1903 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows Server 2016 (Server Core installation)
Windows 10 Version 1709 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1709 for ARM64-based Systems
Yammer for Android

Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows Server, version 1803 (Server Core Installation)
Azure DevOps Server 2019.0.1
Microsoft Visual Studio 2015 Update 3
Windows 10 Version 1703 for 32-bit Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
Team Foundation Server 2018 Update 1.2
.NET Core 2.2
Windows 10 Version 1803 for ARM64-based Systems
Windows 10 Version 1903 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Team Foundation Server 2015 Update 4.2
Microsoft Visual Studio 2017 version 15.0
Windows Server 2016
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

MS20-APR: Microsoft Internet Explorer Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their April 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-0895 - Windows VBScript Engine Remote Code Execution Vulnerability
CVE-2020-0966 - VBScript Remote Code Execution Vulnerability
CVE-2020-0967 - VBScript Remote Code Execution Vulnerability
CVE-2020-0968 - Scripting Engine Memory Corruption Vulnerability

Affected Products:
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2012
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems

MS20-APR: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their April 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-0784 - DirectX Elevation of Privilege Vulnerability
CVE-2020-0794 - Windows Denial of Service Vulnerability
CVE-2020-0835 - Windows Defender Antimalware Platform Hard Link Elevation of Privilege Vulnerability
CVE-2020-0899 - Microsoft Visual Studio Elevation of Privilege Vulnerability
CVE-2020-0907 - Microsoft Graphics Components Remote Code Execution Vulnerability
CVE-2020-0910 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2020-0913 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-0917 - Windows Hyper-V Elevation of Privilege Vulnerability
CVE-2020-0918 - Windows Hyper-V Elevation of Privilege Vulnerability
CVE-2020-0935 - OneDrive for Windows Elevation of Privilege Vulnerability
CVE-2020-0944 - Connected User Experiences and Telemetry Service Elevation of Privilege Vulnerability
CVE-2020-0945 - Media Foundation Information Disclosure Vulnerability
CVE-2020-0946 - Media Foundation Information Disclosure Vulnerability
CVE-2020-0947 - Media Foundation Information Disclosure Vulnerability
CVE-2020-0948 - Media Foundation Memory Corruption Vulnerability
CVE-2020-0949 - Media Foundation Memory Corruption Vulnerability
CVE-2020-0950 - Media Foundation Memory Corruption Vulnerability
CVE-2020-0955 - Windows Kernel Information Disclosure in CPU Memory Access
CVE-2020-0985 - Windows Update Stack Elevation of Privilege Vulnerability
CVE-2020-0987 - Microsoft Graphics Component Information Disclosure Vulnerability
CVE-2020-0988 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-0992 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-0993 - Windows DNS Denial of Service Vulnerability
CVE-2020-0994 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-0995 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-0996 - Windows Update Stack Elevation of Privilege Vulnerability
CVE-2020-0999 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1000 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1001 - Windows Push Notification Service Elevation of Privilege Vulnerability
CVE-2020-1002 - Microsoft Defender Elevation of Privilege Vulnerability
CVE-2020-1003 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1004 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-1005 - Microsoft Graphics Component Information Disclosure Vulnerability
CVE-2020-1006 - Windows Push Notification Service Elevation of Privilege Vulnerability
CVE-2020-1007 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1008 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1018 - Microsoft Dynamics Business Central/NAV Information Disclosure
CVE-2020-1019 - Microsoft RMS Sharing App for Mac Elevation of Privilege Vulnerability
CVE-2020-1026 - MSR JavaScript Cryptography Library Security Feature Bypass Vulnerability
CVE-2020-1027 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1029 - Connected User Experiences and Telemetry Service Elevation of Privilege Vulnerability
CVE-2020-0687 - Microsoft Graphics Remote Code Execution Vulnerability
CVE-2020-0699 - Win32k Information Disclosure Vulnerability
CVE-2020-0821 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-0888 - DirectX Elevation of Privilege Vulnerability
CVE-2020-0889 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-0900 - Visual Studio Extension Installer Service Elevation of Privilege Vulnerability
CVE-2020-0919 - Microsoft Remote Desktop App for Mac Elevation of Privilege Vulnerability
CVE-2020-0934 - Windows Elevation of Privilege Vulnerability

CVE-2020-0936 - Windows Scheduled Task Elevation of Privilege Vulnerability
CVE-2020-0937 - Media Foundation Information Disclosure Vulnerability
CVE-2020-0938 - Adobe Font Manager Library Remote Code Execution Vulnerability
CVE-2020-0939 - Media Foundation Information Disclosure Vulnerability
CVE-2020-0940 - Windows Push Notification Service Elevation of Privilege Vulnerability
CVE-2020-0942 - Connected User Experiences and Telemetry Service Elevation of Privilege Vulnerability
CVE-2020-0943 - Microsoft YourPhone Application for Android Authentication Bypass Vulnerability
CVE-2020-0952 - Windows GDI Information Disclosure Vulnerability
CVE-2020-0953 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-0956 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0957 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0958 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0959 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-0960 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-0962 - Win32k Information Disclosure Vulnerability
CVE-2020-0964 - GDI+ Remote Code Execution Vulnerability
CVE-2020-0965 - Microsoft Windows Codecs Library Remote Code Execution Vulnerability
CVE-2020-0981 - Windows Token Security Feature Bypass Vulnerability
CVE-2020-0982 - Microsoft Graphics Component Information Disclosure Vulnerability
CVE-2020-0983 - Windows Elevation of Privilege Vulnerability
CVE-2020-0984 - Microsoft (MAU) Office Elevation of Privilege Vulnerability
CVE-2020-1009 - Windows Elevation of Privilege Vulnerability
CVE-2020-1011 - Windows Elevation of Privilege Vulnerability
CVE-2020-1014 - Microsoft Windows Update Client Elevation of Privilege Vulnerability
CVE-2020-1015 - Windows Elevation of Privilege Vulnerability
CVE-2020-1016 - Windows Push Notification Service Information Disclosure Vulnerability
CVE-2020-1017 - Windows Push Notification Service Elevation of Privilege Vulnerability
CVE-2020-1020 - Adobe Font Manager Library Remote Code Execution Vulnerability
CVE-2020-1022 - Dynamics Business Central Remote Code Execution Vulnerability
CVE-2020-1049 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-1094 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2020-1050 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows Defender on Windows Server 2019
Windows Defender on Windows Server 2012
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Microsoft Remote Desktop for Mac
Windows Defender on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Defender on Windows 10 Version 1803 for ARM64-based Systems
Dynamics 365 Business Central 2019 Spring Update
Windows Server 2019

Windows Defender on Windows Server 2016 (Server Core installation)
Windows Defender on Windows Server, version 1803 (Server Core Installation)
Microsoft Visual Studio 2019 version 16.0
Microsoft System Center 2012 R2 Endpoint Protection
Windows Defender on Windows Server 2012 R2 (Server Core installation)
Windows Defender on Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 1803 for x64-based Systems
Windows Defender on Windows 10 Version 1903 for x64-based Systems
Dynamics 365 Server, version 9.0 (on-premises)
Windows Defender on Windows Server 2016
Windows 8.1 for x64-based systems
Windows Defender on Windows 7 for 32-bit Systems Service Pack 1
OneDrive for Windows
Windows Defender on Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1903 for 32-bit Systems
Microsoft Visual Studio 2017 version 15.9 (includes 15.1 - 15.8)
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1903 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows 10 Version 1709 for 32-bit Systems
Windows Defender on Windows RT 8.1
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2015 Update 3
Microsoft RMS Sharing for Mac
Windows Defender on Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Microsoft Security Essentials
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
Windows 10 Version 1903 for ARM64-based Systems
Windows Defender on Windows 10 for 32-bit Systems
Windows Defender on Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows Defender on Windows 10 Version 1803 for x64-based Systems
Windows Defender on Windows 10 for x64-based Systems
Microsoft AutoUpdate for Mac
Windows 10 Version 1809 for x64-based Systems
Microsoft Visual Studio 2019 version 16.5
Microsoft Dynamics 365 BC On Premise
Microsoft System Center 2012 Endpoint Protection
Microsoft Forefront Endpoint Protection 2010
Windows Defender on Windows 8.1 for 32-bit systems
Windows Defender on Windows 10 Version 1709 for ARM64-based Systems
Windows Defender on Windows 10 Version 1903 for ARM64-based Systems
Dynamics 365 Business Central 2019 Release Wave 2 (On-Premise)
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1

Windows Defender on Windows 10 Version 1803 for 32-bit Systems
Windows Defender on Windows 10 Version 1903 for 32-bit Systems
Windows Defender on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft Dynamics NAV 2015
Windows Defender on Windows 10 Version 1607 for 32-bit Systems
Windows Defender on Windows 10 Version 1909 for ARM64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows Defender antimalware platform
Windows 10 Version 1709 for x64-based Systems
Windows Defender on Windows 10 Version 1709 for x64-based Systems
Microsoft Dynamics NAV 2013
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows Defender on Windows 10 Version 1607 for x64-based Systems
Windows Defender on Windows 10 Version 1709 for 32-bit Systems
Windows Defender on Windows 8.1 for x64-based systems
Windows Defender on Windows Server 2019 (Server Core installation)
Windows Server, version 1909 (Server Core installation)
Windows Defender on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows Defender on Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows Defender on Windows Server, version 1909 (Server Core installation)
Microsoft Your Phone Companion App for Android
Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows 10 Version 1909 for ARM64-based Systems
Windows Defender on Windows Server, version 1903 (Server Core installation)
Microsoft Dynamics NAV 2016
Microsoft Dynamics NAV 2018
Windows 10 Version 1709 for ARM64-based Systems
Microsoft Research JavaScript Cryptography Library V1.4
Microsoft Dynamics NAV 2017
Windows Defender on Windows 10 Version 1809 for 32-bit Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows Server, version 1803 (Server Core Installation)
Windows Defender on Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows Defender on Windows Server 2012 R2
Windows 10 Version 1803 for ARM64-based Systems
Windows Defender on Windows 10 Version 1809 for ARM64-based Systems
Microsoft System Center Endpoint Protection
Windows Defender on Windows Server 2012 (Server Core installation)
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows Defender on Windows 7 for x64-based Systems Service Pack 1

MS20-AUG: Microsoft Internet Explorer Security Update High

Solution Details

Microsoft has released a fix for this flaw in their August 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-1380 - Scripting Engine Memory Corruption Vulnerability
CVE-2020-1567 - MSHTML Engine Remote Code Execution Vulnerability
CVE-2020-1570 - Scripting Engine Memory Corruption Vulnerability

Affected Products:
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems

Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for ARM64-based Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows Server 2012
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 2004 for 32-bit Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

MS20-AUG: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their August 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-1417 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1464 - Windows Spoofing Vulnerability
CVE-2020-1470 - Windows Work Folders Service Elevation of Privilege Vulnerability
CVE-2020-1509 - Local Security Authority Subsystem Service Elevation of Privilege Vulnerability
CVE-2020-1510 - Win32k Information Disclosure Vulnerability

CVE-2020-1516 - Windows Work Folders Service Elevation of Privilege Vulnerability
CVE-2020-1517 - Windows File Server Resource Management Service Elevation of Privilege Vulnerability
CVE-2020-1518 - Windows File Server Resource Management Service Elevation of Privilege Vulnerability
CVE-2020-1519 - Windows UPnP Device Host Elevation of Privilege Vulnerability
CVE-2020-1520 - Windows Font Driver Host Remote Code Execution Vulnerability
CVE-2020-1521 - Windows Speech Runtime Elevation of Privilege Vulnerability
CVE-2020-1522 - Windows Speech Runtime Elevation of Privilege Vulnerability
CVE-2020-1524 - Windows Speech Shell Components Elevation of Privilege Vulnerability
CVE-2020-1525 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1526 - Windows Network Connection Broker Elevation of Privilege Vulnerability
CVE-2020-1527 - Windows Custom Protocol Engine Elevation of Privilege Vulnerability
CVE-2020-1528 - Windows Radio Manager API Elevation of Privilege Vulnerability
CVE-2020-1529 - Windows GDI Elevation of Privilege Vulnerability
CVE-2020-1530 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-1531 - Windows Accounts Control Elevation of Privilege Vulnerability
CVE-2020-1533 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2020-1534 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-1535 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1536 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1537 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-1538 - Windows UPnP Device Host Elevation of Privilege Vulnerability
CVE-2020-1539 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1540 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1541 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1542 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1543 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1544 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1545 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1546 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1547 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1548 - Windows WaasMedic Service Information Disclosure Vulnerability
CVE-2020-1549 - Windows CDP User Components Elevation of Privilege Vulnerability
CVE-2020-1550 - Windows CDP User Components Elevation of Privilege Vulnerability
CVE-2020-1377 - Windows Registry Elevation of Privilege Vulnerability
CVE-2020-1378 - Windows Registry Elevation of Privilege Vulnerability
CVE-2020-1379 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1383 - Windows RRAS Service Information Disclosure Vulnerability
CVE-2020-1455 - Microsoft SQL Server Management Studio Denial of Service Vulnerability
CVE-2020-1459 - Windows ARM Information Disclosure Vulnerability
CVE-2020-1339 - Windows Media Remote Code Execution Vulnerability
CVE-2020-1337 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2020-1466 - Windows Remote Desktop Gateway (RD Gateway) Denial of Service Vulnerability
CVE-2020-1467 - Windows Hard Link Elevation of Privilege Vulnerability
CVE-2020-1472 - Netlogon Elevation of Privilege Vulnerability
CVE-2020-1473 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1474 - Windows Image Acquisition Service Information Disclosure Vulnerability
CVE-2020-1475 - Windows Server Resource Management Service Elevation of Privilege Vulnerability
CVE-2020-1477 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1478 - Media Foundation Memory Corruption Vulnerability

CVE-2020-1479 - DirectX Elevation of Privilege Vulnerability
CVE-2020-1480 - Windows GDI Elevation of Privilege Vulnerability
CVE-2020-1484 - Windows Work Folders Service Elevation of Privilege Vulnerability
CVE-2020-1485 - Windows Image Acquisition Service Information Disclosure Vulnerability
CVE-2020-1486 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1487 - Media Foundation Information Disclosure Vulnerability
CVE-2020-1488 - Windows AppX Deployment Extensions Elevation of Privilege Vulnerability
CVE-2020-1489 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2020-1490 - Windows Storage Service Elevation of Privilege Vulnerability
CVE-2020-1492 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1511 - Connected User Experiences and Telemetry Service Elevation of Privilege Vulnerability
CVE-2020-1512 - Windows State Repository Service Information Disclosure Vulnerability
CVE-2020-1513 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2020-1515 - Windows Telephony Server Elevation of Privilege Vulnerability
CVE-2020-1551 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-1552 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2020-1553 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1554 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1556 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2020-1557 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1558 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1560 - Microsoft Windows Codecs Library Remote Code Execution Vulnerability
CVE-2020-1561 - Microsoft Graphics Components Remote Code Execution Vulnerability
CVE-2020-1562 - Microsoft Graphics Components Remote Code Execution Vulnerability
CVE-2020-1564 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1565 - Windows Elevation of Privilege Vulnerability
CVE-2020-1566 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1571 - Windows Setup Elevation of Privilege Vulnerability
CVE-2020-1574 - Microsoft Windows Codecs Library Remote Code Execution Vulnerability
CVE-2020-1577 - DirectWrite Information Disclosure Vulnerability
CVE-2020-1578 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1579 - Windows Function Discovery SSDP Provider Elevation of Privilege Vulnerability
CVE-2020-1584 - Windows dnsrslvr.dll Elevation of Privilege Vulnerability
CVE-2020-1585 - Microsoft Windows Codecs Library Remote Code Execution Vulnerability
CVE-2020-1587 - Windows Ancillary Function Driver for WinSock Elevation of Privilege Vulnerability
CVE-2020-1591 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-1597 - ASP.NET Core Denial of Service Vulnerability
CVE-2020-0604 - Visual Studio Code Remote Code Execution Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)

Windows Server 2019
Microsoft Visual Studio 2019 version 16.0
Windows 10 Version 1803 for x64-based Systems
Windows 8.1 for x64-based systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1903 for 32-bit Systems
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1903 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows 10 Version 1709 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows Server, version 2004 (Server Core installation)
Windows 10 Version 1903 for ARM64-based Systems
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows 10 Version 1809 for x64-based Systems
ASP.NET Core 2.1
SQL Server Management Studio 18.6
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows 10 Version 1709 for x64-based Systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
ASP.NET Core 3.1
Windows Server, version 1909 (Server Core installation)
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
Windows 10 Version 1709 for ARM64-based Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows 10 Version 1803 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 8.8

MS20-DEC: Microsoft Windows Security Update High

Solution Details

Microsoft has released a fix for this flaw in their December 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-17092 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-17094 - Windows Error Reporting Information Disclosure Vulnerability
CVE-2020-17095 - Hyper-V Remote Code Execution Vulnerability
CVE-2020-17096 - Windows NTFS Remote Code Execution Vulnerability
CVE-2020-17097 - Windows Digital Media Receiver Elevation of Privilege Vulnerability
CVE-2020-17098 - Windows GDI+ Information Disclosure Vulnerability
CVE-2020-17099 - Windows Lock Screen Security Feature Bypass Vulnerability
CVE-2020-17103 - Windows Cloud Files Mini Filter Driver Elevation of Privilege Vulnerability
CVE-2020-17134 - Windows Cloud Files Mini Filter Driver Elevation of Privilege Vulnerability
CVE-2020-17135 - Azure DevOps Server Spoofing Vulnerability
CVE-2020-17136 - Windows Cloud Files Mini Filter Driver Elevation of Privilege Vulnerability
CVE-2020-17137 - DirectX Graphics Kernel Elevation of Privilege Vulnerability
CVE-2020-17138 - Windows Error Reporting Information Disclosure Vulnerability
CVE-2020-17139 - Windows Overlay Filter Security Feature Bypass Vulnerability
CVE-2020-17147 - Dynamics CRM Webclient Cross-site Scripting Vulnerability
CVE-2020-17148 - Visual Studio Code Remote Development Extension Remote Code Execution Vulnerability
CVE-2020-17150 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2020-17152 - Microsoft Dynamics 365 for Finance and Operations (on-premises) Remote Code Execution Vulnerability
CVE-2020-17156 - Visual Studio Remote Code Execution Vulnerability
CVE-2020-17158 - Microsoft Dynamics 365 for Finance and Operations (on-premises) Remote Code

Execution Vulnerability
CVE-2020-17159 - Visual Studio Code Java Extension Pack Remote Code Execution Vulnerability
CVE-2020-17160 - Azure Sphere Security Feature Bypass Vulnerability
ADV200013 - Microsoft Guidance for Addressing Spoofing Vulnerability in DNS Resolver
CVE-2020-16958 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-16959 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-16960 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-16961 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-16962 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-16963 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-16964 - Windows Backup Engine Elevation of Privilege Vulnerability
CVE-2020-16971 - Azure SDK for Java Security Feature Bypass Vulnerability
CVE-2020-16996 - Kerberos Security Feature Bypass Vulnerability
CVE-2020-17002 - Azure SDK for C Security Feature Bypass Vulnerability
CVE-2020-17133 - Microsoft Dynamics Business Central/NAV Information Disclosure
CVE-2020-17140 - Windows SMB Information Disclosure Vulnerability
CVE-2020-17145 - Azure DevOps Server and Team Foundation Services Spoofing Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows 10 Version 20H2 for 32-bit Systems
Visual Studio Code Language Support for Java Extension
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2019
Microsoft Visual Studio 2019 version 16.0
Windows 10 Version 1803 for x64-based Systems
Windows 8.1 for x64-based systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1903 for 32-bit Systems
Team Foundation Server 2018 Update 3.2
Windows 10 Version 1803 for 32-bit Systems
Microsoft Dynamics 365 (on-premises) version 8.2
Windows 10 Version 1903 for x64-based Systems
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Azure DevOps Server 2019.0.1
Windows 10 Version 2004 for ARM64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2

Windows 10 for x64-based Systems
Windows Server, version 2004 (Server Core installation)
Windows 10 Version 1903 for ARM64-based Systems
C SDK for Azure IoT
Azure Sphere
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows 10 Version 1809 for x64-based Systems
Azure DevOps Server 2020
Windows Server, version 20H2 (Server Core Installation)
Dynamics 365 for Finance and Operations
Visual Studio Code TS-Lint Extension
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Microsoft Dynamics NAV 2015
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows Server, version 1909 (Server Core installation)
Team Foundation Server 2017 Update 3.1
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 2004 for 32-bit Systems
Visual Studio Code Remote - SSH Extension
Team Foundation Server 2018 Update 1.2
Windows 10 Version 1803 for ARM64-based Systems
Microsoft Visual Studio 2019 version 16.8
Windows Server 2019 (Server Core installation)
Azure SDK for Java
Windows Server 2016
Team Foundation Server 2015 Update 4.2
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Azure DevOps Server 2019 Update 1.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS20-FEB: Microsoft Internet Explorer Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their February 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-0673 - Scripting Engine Memory Corruption Vulnerability
CVE-2020-0674 - Scripting Engine Memory Corruption Vulnerability
CVE-2020-0706 - Microsoft Browser Information Disclosure Vulnerability

Affected Products:
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for x64-based Systems

Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 10 on Windows Server 2012
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows Server 2012
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for 32-bit Systems

MS20-FEB: Microsoft SQL Server Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their February 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft SQL Server which include fixes for the following vulnerabilities:

CVE-2020-0618 - Microsoft SQL Server Reporting Services Remote Code Execution Vulnerability

Affected Products:
Microsoft SQL Server 2016 for x64-based Systems Service Pack 2 (GDR)
Microsoft SQL Server 2012 for x64-based Systems Service Pack 4 (QFE)
Microsoft SQL Server 2014 Service Pack 3 for x64-based Systems (GDR)
Microsoft SQL Server 2014 Service Pack 3 for 32-bit Systems (CU)
Microsoft SQL Server 2016 for x64-based Systems Service Pack 2 (CU)
Microsoft SQL Server 2012 for 32-bit Systems Service Pack 4 (QFE)
Microsoft SQL Server 2014 Service Pack 3 for x64-based Systems (CU)
Microsoft SQL Server 2014 Service Pack 3 for 32-bit Systems (GDR)

CVSS Base Score: 6.5

CVSS Vector: AV:N/AC:L/Au:S/C:P/I:P/A:P

MS20-FEB: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their February 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-0655 - Remote Desktop ServicesÂ Remote Code Execution Vulnerability

CVE-2020-0660 - Windows Remote Desktop Protocol (RDP) Denial of Service Vulnerability
CVE-2020-0661 - Windows Hyper-V Denial of Service Vulnerability
CVE-2020-0662 - Windows Remote Code Execution Vulnerability
CVE-2020-0665 - Active Directory Elevation of Privilege Vulnerability
CVE-2020-0666 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0667 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0668 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-0669 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-0670 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-0671 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-0672 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-0675 - Windows Key Isolation Service Information Disclosure Vulnerability
CVE-2020-0676 - Windows Key Isolation Service Information Disclosure Vulnerability
CVE-2020-0677 - Windows Key Isolation Service Information Disclosure Vulnerability
CVE-2020-0678 - Windows Error Reporting Manager Elevation of Privilege Vulnerability
CVE-2020-0679 - Windows Function Discovery Service Elevation of Privilege Vulnerability
CVE-2020-0680 - Windows Function Discovery Service Elevation of Privilege Vulnerability
CVE-2020-0681 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2020-0682 - Windows Function Discovery Service Elevation of Privilege Vulnerability
CVE-2020-0683 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-0685 - Windows COM Server Elevation of Privilege Vulnerability
CVE-2020-0686 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-0691 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0701 - Windows Client License Service Elevation of Privilege Vulnerability
CVE-2020-0702 - Surface Hub Security Feature Bypass Vulnerability
CVE-2020-0727 - Connected User Experiences and Telemetry Service Elevation of Privilege Vulnerability
CVE-2020-0728 - Windows Modules Installer Service Information Disclosure Vulnerability
CVE-2020-0729 - LNK Remote Code Execution Vulnerability
CVE-2020-0730 - Windows User Profile Service Elevation of Privilege Vulnerability
CVE-2020-0733 - Windows Malicious Software Removal Tool Elevation of Privilege Vulnerability
CVE-2020-0734 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2020-0735 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0736 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-0737 - Windows Elevation of Privilege Vulnerability
CVE-2020-0738 - Media Foundation Memory Corruption Vulnerability
CVE-2020-0739 - Windows Elevation of Privilege Vulnerability
CVE-2020-0740 - Connected Devices Platform Service Elevation of Privilege Vulnerability
CVE-2020-0741 - Connected Devices Platform Service Elevation of Privilege Vulnerability
CVE-2020-0742 - Connected Devices Platform Service Elevation of Privilege Vulnerability
CVE-2020-0743 - Connected Devices Platform Service Elevation of Privilege Vulnerability
CVE-2020-0745 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-0746 - Microsoft Graphics Components Information Disclosure Vulnerability
CVE-2020-0747 - Windows Data Sharing Service Elevation of Privilege Vulnerability
CVE-2020-0748 - Windows Key Isolation Service Information Disclosure Vulnerability
CVE-2020-0749 - Connected Devices Platform Service Elevation of Privilege Vulnerability
CVE-2020-0750 - Connected Devices Platform Service Elevation of Privilege Vulnerability
CVE-2020-0751 - Windows Hyper-V Denial of Service Vulnerability
CVE-2020-0752 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0753 - Windows Error Reporting Elevation of Privilege Vulnerability

CVE-2020-0754 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-0755 - Windows Key Isolation Service Information Disclosure Vulnerability
CVE-2020-0756 - Windows Key Isolation Service Information Disclosure Vulnerability
CVE-2020-0757 - Windows SSH Elevation of Privilege Vulnerability
CVE-2020-0792 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-0657 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2020-0658 - Windows Common Log File System Driver Information Disclosure Vulnerability
CVE-2020-0659 - Windows Data Sharing Service Elevation of Privilege Vulnerability
CVE-2020-0689 - Microsoft Secure Boot Security Feature Bypass Vulnerability
CVE-2020-0698 - Windows Information Disclosure Vulnerability
CVE-2020-0703 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-0704 - Windows Wireless Network Manager Elevation of Privilege Vulnerability
CVE-2020-0705 - Windows Network Driver Interface Specification (NDIS) Information Disclosure Vulnerability
CVE-2020-0707 - Windows IME Elevation of Privilege Vulnerability
CVE-2020-0708 - Windows Imaging Library Remote Code Execution Vulnerability
CVE-2020-0709 - DirectX Elevation of Privilege Vulnerability
CVE-2020-0714 - DirectX Information Disclosure Vulnerability
CVE-2020-0715 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-0716 - Win32k Information Disclosure Vulnerability
CVE-2020-0717 - Win32k Information Disclosure Vulnerability
CVE-2020-0719 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0720 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0721 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0722 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0723 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0724 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0725 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0726 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0731 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0732 - DirectX Elevation of Privilege Vulnerability
CVE-2020-0744 - Windows GDI Information Disclosure Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Malicious Software Removal Tool 64-bit
Windows Server 2012 (Server Core installation)
Windows Server 2019
Windows 10 Version 1803 for x64-based Systems
Windows 8.1 for x64-based systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1903 for 32-bit Systems
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1903 for x64-based Systems

Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Microsoft Surface Hub
Windows 10 Version 1709 for 32-bit Systems
Windows Malicious Software Removal Tool 32-bit
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 Version 1903 for ARM64-based Systems
Windows 10 Version 1809 for x64-based Systems
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows 10 Version 1709 for x64-based Systems
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows Server, version 1909 (Server Core installation)
Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows 10 Version 1909 for ARM64-based Systems
Windows 10 Version 1709 for ARM64-based Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows Server, version 1803 (Server Core Installation)
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 1803 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

MS20-JAN: Microsoft Internet Explorer Security Update High

Solution Details

Microsoft has released a fix for this flaw in their January 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-0640 - Internet Explorer Memory Corruption Vulnerability

Affected Products:
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 10 on Windows Server 2012
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2

Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows Server 2012
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2

MS20-JAN: Microsoft Windows Security Update High

Solution Details

Microsoft has released a fix for this flaw in their January 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-0601 - Windows CryptoAPI Spoofing Vulnerability
CVE-2020-0607 - Microsoft Graphics Components Information Disclosure Vulnerability
CVE-2020-0608 - Win32k Information Disclosure Vulnerability
CVE-2020-0609 - Windows Remote Desktop Gateway (RD Gateway) Remote Code Execution Vulnerability
CVE-2020-0610 - Windows Remote Desktop Gateway (RD Gateway) Remote Code Execution Vulnerability
CVE-2020-0611 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2020-0612 - Windows Remote Desktop Gateway (RD Gateway) Denial of Service Vulnerability
CVE-2020-0613 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0614 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0615 - Windows Common Log File System Driver Information Disclosure Vulnerability
CVE-2020-0616 - Microsoft Windows Denial of Service Vulnerability
CVE-2020-0617 - Hyper-V Denial of Service Vulnerability
CVE-2020-0636 - Windows Subsystem for Linux Elevation of Privilege Vulnerability
CVE-2020-0637 - Remote Desktop Web Access Information Disclosure Vulnerability
CVE-2020-0638 - Update Notification Manager Elevation of Privilege Vulnerability
CVE-2020-0639 - Windows Common Log File System Driver Information Disclosure Vulnerability
CVE-2020-0602 - ASP.NET Core Denial of Service Vulnerability
CVE-2020-0603 - ASP.NET Core Remote Code Execution Vulnerability
CVE-2020-0620 - Microsoft Cryptographic Services Elevation of Privilege Vulnerability
CVE-2020-0621 - Windows Security Feature Bypass Vulnerability
CVE-2020-0622 - Microsoft Graphics Component Information Disclosure Vulnerability
CVE-2020-0623 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0624 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0625 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0626 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0627 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0628 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0629 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0630 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0631 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0632 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0633 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0634 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2020-0635 - Windows Elevation of Privilege Vulnerability
CVE-2020-0654 - Microsoft OneDrive for Android Security Feature Bypass Vulnerability
CVE-2020-0656 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-0641 - Microsoft Windows Elevation of Privilege Vulnerability
CVE-2020-0642 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0643 - Windows GDI+ Information Disclosure Vulnerability
CVE-2020-0644 - Windows Elevation of Privilege Vulnerability

Affected Products:
ASP.NET Core 2.1
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
ASP.NET Core 3.0

Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2012
Windows Server 2019
Windows 7 for x64-based Systems Service Pack 1
Windows 10 Version 1803 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows 10 Version 1709 for x64-based Systems
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
ASP.NET Core 3.1
Dynamics 365 Field Service (on-premises) v7 series
Windows Server, version 1909 (Server Core installation)
One Drive for Android
Windows 10 Version 1909 for x64-based Systems
Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows 10 Version 1903 for 32-bit Systems
Windows 10 Version 1909 for ARM64-based Systems
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 1903 for x64-based Systems
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows 10 Version 1709 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1709 for ARM64-based Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows Server, version 1803 (Server Core Installation)
Windows 10 Version 1909 for 32-bit Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
Windows 10 Version 1803 for ARM64-based Systems
Windows 10 Version 1903 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

MS20-JUL: Microsoft Internet Explorer Security Update High

Solution Details

Microsoft has released a fix for this flaw in their July 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-1403 - VBScript Remote Code Execution Vulnerability
CVE-2020-1416 - Visual Studio and Visual Studio Code Elevation of Privilege Vulnerability
CVE-2020-1432 - Skype for Business via Internet Explorer Information Disclosure Vulnerability

Affected Products:
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Microsoft Visual Studio 2019 version 16.6 (includes 16.0 - 16.5)
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Microsoft Visual Studio 2019 version 16.0
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Visual Studio Code
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Azure Storage Explorer
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for ARM64-based Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
TypeScript

Internet Explorer 11 on Windows Server 2012
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 2004 for 32-bit Systems

MS20-JUL: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their July 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-1336 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1350 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2020-1418 - Windows Diagnostics Hub Elevation of Privilege Vulnerability
CVE-2020-1419 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1420 - Windows Error Reporting Information Disclosure Vulnerability
CVE-2020-1421 - LNK Remote Code Execution Vulnerability
CVE-2020-1422 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1423 - Windows Subsystem for Linux Elevation of Privilege Vulnerability
CVE-2020-1424 - Windows Update Stack Elevation of Privilege Vulnerability
ADV200008 - Microsoft Guidance for Enabling Request Smuggling Filter on IIS Servers
CVE-2020-1344 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2020-1346 - Windows Modules Installer Elevation of Privilege Vulnerability
CVE-2020-1347 - Windows Storage Services Elevation of Privilege Vulnerability
CVE-2020-1351 - Microsoft Graphics Component Information Disclosure Vulnerability
CVE-2020-1352 - Windows USO Core Worker Elevation of Privilege Vulnerability
CVE-2020-1353 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1354 - Windows UPnP Device Host Elevation of Privilege Vulnerability
CVE-2020-1355 - Windows Font Driver Host Remote Code Execution Vulnerability
CVE-2020-1356 - Windows iSCSI Target Service Elevation of Privilege Vulnerability
CVE-2020-1357 - Windows System Events Broker Elevation of Privilege Vulnerability
CVE-2020-1358 - Windows Resource Policy Information Disclosure Vulnerability
CVE-2020-1359 - Windows CNG Key Isolation Service Elevation of Privilege Vulnerability
CVE-2020-1360 - Windows Profile Service Elevation of Privilege Vulnerability
CVE-2020-1361 - Windows WalletService Information Disclosure Vulnerability
CVE-2020-1362 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2020-1363 - Windows Picker Platform Elevation of Privilege Vulnerability
CVE-2020-1364 - Windows WalletService Denial of Service Vulnerability
CVE-2020-1365 - Windows Event Logging Service Elevation of Privilege Vulnerability
CVE-2020-1366 - Windows Print Workflow Service Elevation of Privilege Vulnerability
CVE-2020-1367 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1368 - Windows Credential Enrollment Manager Service Elevation of Privilege Vulnerability
CVE-2020-1369 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2020-1370 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1371 - Windows Event Logging Service Elevation of Privilege Vulnerability
CVE-2020-1372 - Windows Mobile Device Management Diagnostics Elevation of Privilege Vulnerability

CVE-2020-1373 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-1374 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2020-1375 - Windows COM Server Elevation of Privilege Vulnerability
CVE-2020-1381 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-1382 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-1384 - Windows CNG Key Isolation Service Elevation of Privilege Vulnerability
CVE-2020-1385 - Windows Credential Picker Elevation of Privilege Vulnerability
CVE-2020-1386 - Connected User Experiences and Telemetry Service Information Disclosure Vulnerability
CVE-2020-1387 - Windows Push Notification Service Elevation of Privilege Vulnerability
CVE-2020-1388 - Windows Elevation of Privilege Vulnerability
CVE-2020-1389 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1390 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-1391 - Windows Agent Activation Runtime Information Disclosure Vulnerability
CVE-2020-1392 - Windows Elevation of Privilege Vulnerability
CVE-2020-1393 - Windows Diagnostics Hub Elevation of Privilege Vulnerability
CVE-2020-1394 - Windows Elevation of Privilege Vulnerability
CVE-2020-1395 - Windows Elevation of Privilege Vulnerability
CVE-2020-1396 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2020-1397 - Windows Imaging Component Information Disclosure Vulnerability
CVE-2020-1398 - Windows Lockscreen Elevation of Privilege Vulnerability
CVE-2020-1399 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1400 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1401 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1402 - Windows ActiveX Installer Service Elevation of Privilege Vulnerability
CVE-2020-1404 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1405 - Windows Mobile Device Management Diagnostics Elevation of Privilege Vulnerability
CVE-2020-1406 - Windows Network List Service Elevation of Privilege Vulnerability
CVE-2020-1407 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1408 - Microsoft Graphics Remote Code Execution Vulnerability
CVE-2020-1410 - Windows Address Book Remote Code Execution Vulnerability
CVE-2020-1411 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1412 - Microsoft Graphics Components Remote Code Execution Vulnerability
CVE-2020-1413 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1414 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1415 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1426 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1427 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-1428 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-1429 - Windows Error Reporting Manager Elevation of Privilege Vulnerability
CVE-2020-1430 - Windows UPnP Device Host Elevation of Privilege Vulnerability
CVE-2020-1431 - Windows AppX Deployment Extensions Elevation of Privilege Vulnerability
CVE-2020-1434 - Windows Sync Host Service Elevation of Privilege Vulnerability
CVE-2020-1435 - GDI+ Remote Code Execution Vulnerability
CVE-2020-1436 - Windows Font Library Remote Code Execution Vulnerability
CVE-2020-1437 - Windows Network Location Awareness Service Elevation of Privilege Vulnerability
CVE-2020-1438 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-1458 - Microsoft Office Remote Code Execution Vulnerability
CVE-2020-1461 - Microsoft Defender Elevation of Privilege Vulnerability

CVE-2020-1463 - Windows SharedStream Library Elevation of Privilege Vulnerability
CVE-2020-1465 - Microsoft OneDrive Elevation of Privilege Vulnerability
CVE-2020-1468 - Windows GDI Information Disclosure Vulnerability
CVE-2020-1469 - Bond Denial of Service Vulnerability
CVE-2020-1481 - Visual Studio Code ESLint Extention Remote Code Execution Vulnerability
CVE-2020-1032 - Hyper-V RemoteFX vGPU Remote Code Execution Vulnerability
CVE-2020-1036 - Hyper-V RemoteFX vGPU Remote Code Execution Vulnerability
CVE-2020-1040 - Hyper-V RemoteFX vGPU Remote Code Execution Vulnerability
CVE-2020-1041 - Hyper-V RemoteFX vGPU Remote Code Execution Vulnerability
CVE-2020-1043 - Hyper-V RemoteFX vGPU Remote Code Execution Vulnerability
CVE-2020-1240 - Microsoft Excel Remote Code Execution Vulnerability
CVE-2020-1249 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1267 - Local Security Authority Subsystem Service Denial of Service Vulnerability
CVE-2020-1333 - Group Policy Services Policy Processing Elevation of Privilege Vulnerability
CVE-2020-1042 - Hyper-V RemoteFX vGPU Remote Code Execution Vulnerability
CVE-2020-1085 - Windows Function Discovery Service Elevation of Privilege Vulnerability
CVE-2020-1326 - Azure DevOps Server Cross-site Scripting Vulnerability
CVE-2020-1330 - Windows Mobile Device Management Diagnostics Information Disclosure Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Microsoft Visual Studio 2019 version 16.6 (includes 16.0 - 16.5)
Windows Defender on Windows Server 2019
Windows Defender on Windows Server 2012
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)

MS20-JUN: Microsoft Internet Explorer Security Update High

Solution Details

Microsoft has released a fix for this flaw in their June 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-1213 - VBScript Remote Code Execution Vulnerability
CVE-2020-1214 - VBScript Remote Code Execution Vulnerability
CVE-2020-1215 - VBScript Remote Code Execution Vulnerability
CVE-2020-1216 - VBScript Remote Code Execution Vulnerability
CVE-2020-1219 - Microsoft Browser Memory Corruption Vulnerability
CVE-2020-1230 - VBScript Remote Code Execution Vulnerability
CVE-2020-1260 - VBScript Remote Code Execution Vulnerability
CVE-2020-1315 - Internet Explorer Information Disclosure Vulnerability

Affected Products:
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for ARM64-based Systems

Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for ARM64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for x64-based Systems
ChakraCore
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows RT 8.1
Microsoft Edge (EdgeHTML-based) on Windows 10 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows Server 2012
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2

Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 2004 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for x64-based Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

MS20-JUN: Microsoft Windows Security Update High

Solution Details

Microsoft has released a fix for this flaw in their June 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-0915 - Windows GDI Elevation of Privilege Vulnerability
CVE-2020-0916 - Windows GDI Elevation of Privilege Vulnerability
CVE-2020-0986 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1334 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1348 - Windows GDI Information Disclosure Vulnerability
CVE-2020-1196 - Windows Print Configuration Elevation of Privilege Vulnerability
CVE-2020-1197 - Windows Error Reporting Manager Elevation of Privilege Vulnerability
CVE-2020-1199 - Windows Feedback Hub Elevation of Privilege Vulnerability
CVE-2020-1201 - Windows Now Playing Session Manager Elevation of Privilege Vulnerability
CVE-2020-1202 - Diagnostic Hub Standard Collector Elevation of Privilege Vulnerability

CVE-2020-1203 - Diagnostic Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2020-1204 - Windows Mobile Device Management Diagnostics Elevation of Privilege Vulnerability
CVE-2020-1206 - Windows SMBv3 Client/Server Information Disclosure Vulnerability
CVE-2020-1207 - Win32k Elevation of Privilege Vulnerability
CVE-2020-1208 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1209 - Windows Network List Service Elevation of Privilege Vulnerability
CVE-2020-1211 - Connected Devices Platform Service Elevation of Privilege Vulnerability
CVE-2020-1212 - OLE Automation Elevation of Privilege Vulnerability
CVE-2020-1217 - Windows Runtime Information Disclosure Vulnerability
CVE-2020-1222 - Microsoft Store Runtime Elevation of Privilege Vulnerability
CVE-2020-1340 - NuGetGallery Spoofing Vulnerability
CVE-2020-1343 - Visual Studio Code Live Share Information Disclosure Vulnerability
CVE-2020-1120 - Connected User Experiences and Telemetry Service Denial of Service Vulnerability
CVE-2020-1194 - Windows Registry Denial of Service Vulnerability
CVE-2020-1231 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1232 - Media Foundation Information Disclosure Vulnerability
CVE-2020-1233 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1234 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-1235 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1236 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1237 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1238 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1239 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1246 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1247 - Win32k Elevation of Privilege Vulnerability
CVE-2020-1262 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1269 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1271 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-1274 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1275 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1277 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-1278 - Diagnostics Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2020-1279 - Windows Lockscreen Elevation of Privilege Vulnerability
CVE-2020-1280 - Windows Bluetooth Service Elevation of Privilege Vulnerability
CVE-2020-1282 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1284 - Windows SMBv3 Client/Server Denial of Service Vulnerability
CVE-2020-1286 - Windows Shell Remote Code Execution Vulnerability
CVE-2020-1294 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2020-1300 - Windows Remote Code Execution Vulnerability
CVE-2020-1307 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1310 - Win32k Elevation of Privilege Vulnerability
CVE-2020-1311 - Component Object Model Elevation of Privilege Vulnerability
CVE-2020-1312 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-1316 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1324 - Windows Elevation of Privilege Vulnerability
CVE-2020-1331 - System Center Operations Manager Spoofing Vulnerability
CVE-2020-1160 - Microsoft Graphics Component Information Disclosure Vulnerability
CVE-2020-1162 - Windows Elevation of Privilege Vulnerability
CVE-2020-1163 - Microsoft Windows Defender Elevation of Privilege Vulnerability

CVE-2020-1170 - Microsoft Windows Defender Elevation of Privilege Vulnerability
CVE-2020-1241 - Windows Kernel Security Feature Bypass Vulnerability
CVE-2020-1244 - Connected User Experiences and Telemetry Service Denial of Service Vulnerability
CVE-2020-1248 - GDI+ Remote Code Execution Vulnerability
CVE-2020-1251 - Win32k Elevation of Privilege Vulnerability
CVE-2020-1253 - Win32k Elevation of Privilege Vulnerability
CVE-2020-1254 - Windows Modules Installer Service Elevation of Privilege Vulnerability
CVE-2020-1255 - Windows Background Intelligent Transfer Service Elevation of Privilege Vulnerability
CVE-2020-1257 - Diagnostics Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2020-1258 - DirectX Elevation of Privilege Vulnerability
CVE-2020-1259 - Windows Host Guardian Service Security Feature Bypass Vulnerability
CVE-2020-1261 - Windows Error Reporting Information Disclosure Vulnerability
CVE-2020-1263 - Windows Error Reporting Information Disclosure Vulnerability
CVE-2020-1264 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1265 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1266 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1268 - Windows Service Information Disclosure Vulnerability
CVE-2020-1270 - Windows WLAN Service Elevation of Privilege Vulnerability
CVE-2020-1272 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-1273 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1276 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1281 - Windows OLE Remote Code Execution Vulnerability
CVE-2020-1283 - Windows Denial of Service Vulnerability
CVE-2020-1287 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2020-1290 - Win32k Information Disclosure Vulnerability
CVE-2020-1291 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-1292 - OpenSSH for Windows Elevation of Privilege Vulnerability
CVE-2020-1293 - Diagnostics Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2020-1296 - Windows Diagnostics & feedback Information Disclosure Vulnerability
CVE-2020-1299 - LNK Remote Code Execution Vulnerability
CVE-2020-1301 - Windows SMB Remote Code Execution Vulnerability
CVE-2020-1302 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-1304 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1305 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1306 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1309 - Microsoft Store Runtime Elevation of Privilege Vulnerability
CVE-2020-1313 - Windows Update Orchestrator Service Elevation of Privilege Vulnerability
CVE-2020-1314 - Windows Text Service Framework Elevation of Privilege Vulnerability
CVE-2020-1317 - Group Policy Elevation of Privilege Vulnerability
CVE-2020-1327 - Azure DevOps Server HTML Injection Vulnerability
CVE-2020-1329 - Microsoft Bing Search Spoofing Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Microsoft Visual Studio 2019 version 16.6 (includes 16.0 - 16.5)
Windows Defender on Windows Server 2019

Windows Defender on Windows Server 2012
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows Defender on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Defender on Windows 10 Version 1803 for ARM64-based Systems
Windows Server 2019
Windows Defender on Windows Server 2016 (Server Core installation)
Windows Defender on Windows Server, version 1803 (Server Core Installation)
Microsoft Visual Studio 2019 version 16.0
Microsoft System Center 2012 R2 Endpoint Protection
Windows Defender on Windows Server 2012 R2 (Server Core installation)
Windows Defender on Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 1803 for x64-based Systems
Windows Defender on Windows 10 Version 1903 for x64-based Systems
Windows Defender on Windows Server 2016
Windows 8.1 for x64-based systems
Windows Defender on Windows 7 for 32-bit Systems Service Pack 1
System Center 2016 Operations Manager
Windows Defender on Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 1909 for x64-based Systems
Azure DevOps Server 2019 Update 1
Windows 10 Version 1903 for 32-bit Systems
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1903 for x64-based Systems
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 2004 for HoloLens
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows 10 Version 1709 for 32-bit Systems
Windows Defender on Windows RT 8.1
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Azure DevOps Server 2019.0.1
Windows 10 Version 2004 for ARM64-based Systems
Microsoft Visual Studio 2015 Update 3
Windows Defender on Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Microsoft Security Essentials
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
NuGetGallery
Windows Server, version 2004 (Server Core installation)
Windows 10 Version 1903 for ARM64-based Systems
Windows Defender on Windows 10 for 32-bit Systems
Windows Defender on Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows Defender on Windows 10 Version 1803 for x64-based Systems

Windows Defender on Windows 10 for x64-based Systems
Windows 10 Version 1809 for HoloLens
Windows 10 Version 1809 for x64-based Systems
Microsoft System Center 2012 Endpoint Protection
Microsoft Forefront Endpoint Protection 2010
Windows Defender on Windows 8.1 for 32-bit systems
Windows Defender on Windows 10 Version 1709 for ARM64-based Systems
Windows Defender on Windows 10 Version 1903 for ARM64-based Systems
Microsoft Visual Studio Code Live Share extension
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows Defender on Windows 10 Version 1803 for 32-bit Systems
Windows Defender on Windows 10 Version 1903 for 32-bit Systems
Windows Defender on Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Defender on Windows 10 Version 1607 for 32-bit Systems
Windows Defender on Windows 10 Version 1909 for ARM64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows 10 Version 1709 for x64-based Systems
Windows Server 2012 R2 (Server Core installation)
Windows Defender on Windows 10 Version 1709 for x64-based Systems
Windows Server 2012 R2
Microsoft Bing Search for Android
Windows 8.1 for 32-bit systems
Windows Defender on Windows 10 Version 1607 for x64-based Systems
Windows Defender on Windows 10 Version 1709 for 32-bit Systems
Windows Defender on Windows 8.1 for x64-based systems
Windows Defender on Windows Server 2019 (Server Core installation)
Windows Server, version 1909 (Server Core installation)
Windows 10 Version 1903 for HoloLens
Windows Defender on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows Defender on Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows Defender on Windows Server, version 1909 (Server Core installation)
Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows 10 Version 1909 for ARM64-based Systems
Windows Defender on Windows Server, version 1903 (Server Core installation)
Windows 10 Version 1709 for ARM64-based Systems
Windows Defender on Windows 10 Version 1809 for 32-bit Systems
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Windows Server, version 1803 (Server Core Installation)
Windows Defender on Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Defender on Windows Server 2012 R2
Windows 10 Version 1803 for ARM64-based Systems
Windows Defender on Windows 10 Version 1809 for ARM64-based Systems
Microsoft System Center Endpoint Protection
Windows Defender on Windows Server 2012 (Server Core installation)

Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Azure DevOps Server 2019 Update 1.1
Windows Defender on Windows 7 for x64-based Systems Service Pack 1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 8.8

MS20-MAR: Microsoft Internet Explorer Security Update High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-0768 - Scripting Engine Memory Corruption Vulnerability
CVE-2020-0824 - Internet Explorer Memory Corruption Vulnerability
CVE-2020-0830 - Scripting Engine Memory Corruption Vulnerability
CVE-2020-0832 - Scripting Engine Memory Corruption Vulnerability
CVE-2020-0833 - Scripting Engine Memory Corruption Vulnerability
CVE-2020-0847 - VBScript Remote Code Execution Vulnerability

Affected Products:
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for x64-based Systems

Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for x64-based Systems
ChakraCore
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows RT 8.1
Microsoft Edge (EdgeHTML-based) on Windows 10 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2019
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2012

Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for x64-based Systems

Solution Details

Microsoft has released a fix for this flaw in their March 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

MS20-MAR: Microsoft Windows Security Update — High

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-0684 - LNK Remote Code Execution Vulnerability
CVE-2020-0700 - Azure DevOps Server Cross-site Scripting Vulnerability
CVE-2020-0758 - Azure DevOps Server and Team Foundation Services Elevation of Privilege Vulnerability
CVE-2020-0762 - Windows Defender Security Center Elevation of Privilege Vulnerability
CVE-2020-0763 - Windows Defender Security Center Elevation of Privilege Vulnerability
CVE-2020-0765 - Remote Desktop Connection Manager Information Disclosure Vulnerability
CVE-2020-0777 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2020-0778 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-0779 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-0780 - Windows Network List Service Elevation of Privilege Vulnerability
CVE-2020-0781 - Windows UPnP Service Elevation of Privilege Vulnerability
CVE-2020-0783 - Windows UPnP Service Elevation of Privilege Vulnerability
CVE-2020-0785 - Windows User Profile Service Elevation of Privilege Vulnerability
CVE-2020-0786 - Windows Tile Object Service Denial of Service Vulnerability
CVE-2020-0787 - Windows Background Intelligent Transfer Service Elevation of Privilege Vulnerability
CVE-2020-0788 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0789 - Visual Studio Extension Installer Service Denial of Service Vulnerability
CVE-2020-0797 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2020-0798 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-0799 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-0800 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2020-0801 - Media Foundation Memory Corruption Vulnerability
CVE-2020-0802 - Windows Network Connections Service Elevation of Privilege Vulnerability

CVE-2020-0803 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-0804 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-0806 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-0807 - Media Foundation Memory Corruption Vulnerability
CVE-2020-0808 - Provisioning Runtime Elevation of Privilege Vulnerability
CVE-2020-0809 - Media Foundation Memory Corruption Vulnerability
CVE-2020-0810 - Diagnostic Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2020-0814 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-0815 - Azure DevOps Server and Team Foundation Services Elevation of Privilege Vulnerability
CVE-2020-0834 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2020-0840 - Windows Hard Link Elevation of Privilege Vulnerability
CVE-2020-0841 - Windows Hard Link Elevation of Privilege Vulnerability
CVE-2020-0842 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-0843 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-0844 - Connected User Experiences and Telemetry Service Elevation of Privilege Vulnerability
CVE-2020-0845 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-0849 - Windows Hard Link Elevation of Privilege Vulnerability
CVE-2020-0853 - Windows Imaging Component Information Disclosure Vulnerability
CVE-2020-0854 - Windows Mobile Device Management Diagnostics Elevation of Privilege Vulnerability
CVE-2020-0872 - Remote Code Execution Vulnerability in Application Inspector
CVE-2020-0884 - Microsoft Visual Studio Spoofing Vulnerability
CVE-2020-0645 - Microsoft IIS Server Tampering Vulnerability
CVE-2020-0690 - DirectX Elevation of Privilege Vulnerability
CVE-2020-0769 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2020-0770 - Windows ActiveX Installer Service Elevation of Privilege Vulnerability
CVE-2020-0771 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2020-0772 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-0773 - Windows ActiveX Installer Service Elevation of Privilege Vulnerability
CVE-2020-0774 - Windows GDI Information Disclosure Vulnerability
CVE-2020-0775 - Windows Error Reporting Information Disclosure Vulnerability
CVE-2020-0776 - Windows Elevation of Privilege Vulnerability
CVE-2020-0791 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-0793 - Diagnostics Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2020-0819 - Windows Device Setup Manager Elevation of Privilege Vulnerability
CVE-2020-0820 - Media Foundation Information Disclosure Vulnerability
CVE-2020-0822 - Windows Language Pack Installer Elevation of Privilege Vulnerability
CVE-2020-0857 - Windows Search Indexer Elevation of Privilege Vulnerability
CVE-2020-0858 - Windows Elevation of Privilege Vulnerability
CVE-2020-0859 - Windows Modules Installer Service Information Disclosure Vulnerability
CVE-2020-0860 - Windows ActiveX Installer Service Elevation of Privilege Vulnerability
CVE-2020-0861 - Windows Network Driver Interface Specification (NDIS) Information Disclosure Vulnerability
CVE-2020-0863 - Connected User Experiences and Telemetry Service Information Disclosure Vulnerability
CVE-2020-0864 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2020-0865 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2020-0866 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2020-0867 - Windows Update Orchestrator Service Elevation of Privilege Vulnerability

CVE-2020-0868 - Windows Update Orchestrator Service Elevation of Privilege Vulnerability
CVE-2020-0869 - Media Foundation Memory Corruption Vulnerability
CVE-2020-0871 - Windows Network Connections Service Information Disclosure Vulnerability
CVE-2020-0874 - Windows GDI Information Disclosure Vulnerability
CVE-2020-0876 - Win32k Information Disclosure Vulnerability
CVE-2020-0877 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0879 - Windows GDI Information Disclosure Vulnerability
CVE-2020-0880 - Windows GDI Information Disclosure Vulnerability
CVE-2020-0881 - GDI+ Remote Code Execution Vulnerability
CVE-2020-0882 - Windows GDI Information Disclosure Vulnerability
CVE-2020-0883 - GDI+ Remote Code Execution Vulnerability
CVE-2020-0885 - Windows Graphics Component Information Disclosure Vulnerability
CVE-2020-0887 - Win32k Elevation of Privilege Vulnerability
CVE-2020-0896 - Windows Hard Link Elevation of Privilege Vulnerability
CVE-2020-0897 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2020-0898 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-0902 - Service Fabric Elevation of Privilege
CVE-2020-0905 - Dynamics Business Central Remote Code Execution Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Dynamics 365 Business Central 2019 Spring Update
Windows Server 2019
Microsoft Visual Studio 2019 version 16.0
Windows 10 Version 1803 for x64-based Systems
Windows 8.1 for x64-based systems
Windows 10 Version 1909 for x64-based Systems
Azure DevOps Server 2019 Update 1
Windows 10 Version 1903 for 32-bit Systems
Microsoft Visual Studio 2017 version 15.9 (includes 15.1 - 15.8)
Team Foundation Server 2018 Update 3.2
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1903 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows 10 Version 1709 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Azure DevOps Server 2019.0.1
Service Fabric
Microsoft Visual Studio 2015 Update 3

Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 Version 1903 for ARM64-based Systems
Windows 10 Version 1809 for x64-based Systems
Remote Desktop Connection Manager 2.7
Microsoft Dynamics 365 BC On Premise
Dynamics 365 Business Central 2019 Release Wave 2 (On-Premise)
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Microsoft Dynamics NAV 2015
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows 10 Version 1709 for x64-based Systems
Windows Server 2012 R2 (Server Core installation)
Microsoft Dynamics NAV 2013
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows Server, version 1909 (Server Core installation)
Team Foundation Server 2017 Update 3.1
Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics NAV 2016
Microsoft Dynamics NAV 2018
Windows 10 Version 1709 for ARM64-based Systems
Microsoft Dynamics NAV 2017
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows Server, version 1803 (Server Core Installation)
Windows 10 Version 1909 for 32-bit Systems
Team Foundation Server 2018 Update 1.2
Windows 10 Version 1803 for ARM64-based Systems
Application Inspector
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Azure DevOps Server 2019 Update 1.1

Solution Details

Microsoft has released a fix for this flaw in their March 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 9.8

MS20-MAY: Microsoft Internet Explorer Security Update

High

Solution Details

Microsoft has released a fix for this flaw in their May 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-1035 - VBScript Remote Code Execution Vulnerability
CVE-2020-1058 - VBScript Remote Code Execution Vulnerability
CVE-2020-1060 - VBScript Remote Code Execution Vulnerability
CVE-2020-1062 - Internet Explorer Memory Corruption Vulnerability
CVE-2020-1064 - MSHTML Engine Remote Code Execution Vulnerability
CVE-2020-1093 - VBScript Remote Code Execution Vulnerability
CVE-2020-1092 - Internet Explorer Memory Corruption Vulnerability

Affected Products:
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2012

Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS20-MAY: Microsoft Windows Security Update — High

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-0909 - Windows Hyper-V Denial of Service Vulnerability
CVE-2020-1021 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-1028 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1192 - Visual Studio Code Python Extension Remote Code Execution Vulnerability
CVE-2020-0963 - Windows GDI Information Disclosure Vulnerability
CVE-2020-1010 - Microsoft Windows Elevation of Privilege Vulnerability
CVE-2020-1048 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2020-1054 - Win32k Elevation of Privilege Vulnerability
CVE-2020-1055 - Microsoft Active Directory Federation Services Cross-Site Scripting Vulnerability
CVE-2020-1061 - Microsoft Script Runtime Remote Code Execution Vulnerability
CVE-2020-1063 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-1071 - Windows Remote Access Common Dialog Elevation of Privilege Vulnerability
CVE-2020-1076 - Windows Denial of Service Vulnerability
CVE-2020-1078 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-1084 - Connected User Experiences and Telemetry Service Denial of Service Vulnerability
CVE-2020-1110 - Windows Update Stack Elevation of Privilege Vulnerability

CVE-2020-1113 - Windows Task Scheduler Security Feature Bypass Vulnerability
CVE-2020-1114 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1116 - Windows CSRSS Information Disclosure Vulnerability
CVE-2020-1118 - Microsoft Windows Transport Layer Security Denial of Service Vulnerability
CVE-2020-1124 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1126 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1134 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1135 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-1137 - Windows Push Notification Service Elevation of Privilege Vulnerability
CVE-2020-1138 - Windows Storage Service Elevation of Privilege Vulnerability
CVE-2020-1140 - DirectX Elevation of Privilege Vulnerability
CVE-2020-1143 - Win32k Elevation of Privilege Vulnerability
CVE-2020-1144 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1149 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1150 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1151 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1154 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2020-1155 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1156 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1157 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1158 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1175 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1179 - Windows GDI Information Disclosure Vulnerability
CVE-2020-1186 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1189 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1190 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1051 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1067 - Windows Remote Code Execution Vulnerability
CVE-2020-1068 - Microsoft Windows Elevation of Privilege Vulnerability
CVE-2020-1070 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2020-1072 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1075 - Windows Subsystem for Linux Information Disclosure Vulnerability
CVE-2020-1077 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1079 - Microsoft Windows Elevation of Privilege Vulnerability
CVE-2020-1081 - Windows Printer Service Elevation of Privilege Vulnerability
CVE-2020-1082 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-1086 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1087 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1088 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-1090 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1109 - Windows Update Stack Elevation of Privilege Vulnerability
CVE-2020-1111 - Windows Clipboard Service Elevation of Privilege Vulnerability
CVE-2020-1112 - Windows Background Intelligent Transfer Service Elevation of Privilege Vulnerability
CVE-2020-1117 - Microsoft Color Management Remote Code Execution Vulnerability
CVE-2020-1121 - Windows Clipboard Service Elevation of Privilege Vulnerability
CVE-2020-1123 - Connected User Experiences and Telemetry Service Denial of Service Vulnerability
CVE-2020-1125 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1131 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1132 - Windows Error Reporting Manager Elevation of Privilege Vulnerability

CVE-2020-1136 - Media Foundation Memory Corruption Vulnerability
CVE-2020-1139 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1141 - Windows GDI Information Disclosure Vulnerability
CVE-2020-1142 - Windows GDI Elevation of Privilege Vulnerability
CVE-2020-1145 - Windows GDI Information Disclosure Vulnerability
CVE-2020-1153 - Microsoft Graphics Components Remote Code Execution Vulnerability
CVE-2020-1161 - ASP.NET Core Denial of Service Vulnerability
CVE-2020-1164 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1165 - Windows Clipboard Service Elevation of Privilege Vulnerability
CVE-2020-1166 - Windows Clipboard Service Elevation of Privilege Vulnerability
CVE-2020-1171 - Visual Studio Code Python Extension Remote Code Execution Vulnerability
CVE-2020-1173 - Microsoft Power BI Report Server Spoofing Vulnerability
CVE-2020-1174 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1176 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1184 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1185 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1187 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1188 - Windows State Repository Service Elevation of Privilege Vulnerability
CVE-2020-1191 - Windows State Repository Service Elevation of Privilege Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2019
Microsoft Visual Studio 2019 version 16.0
Windows 10 Version 1803 for x64-based Systems
Windows 8.1 for x64-based systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1903 for 32-bit Systems
Microsoft Visual Studio 2017 version 15.9 (includes 15.1 - 15.8)
Windows 10 Version 1803 for 32-bit Systems
Microsoft Dynamics 365 (on-premises) version 8.2
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 1903 for x64-based Systems
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1709 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 Version 1903 for ARM64-based Systems
Windows 10 Version 1809 for x64-based Systems

Microsoft Visual Studio 2019 version 16.5
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows 10 Version 1709 for x64-based Systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
ASP.NET Core 3.1
Windows Server, version 1909 (Server Core installation)
Power BI Report Server
Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
Windows 10 Version 1709 for ARM64-based Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows Server, version 1803 (Server Core Installation)
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 1803 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

MS20-NOV: Microsoft Internet Explorer Security Update — High

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-17052 - Scripting Engine Memory Corruption Vulnerability
CVE-2020-17053 - Internet Explorer Memory Corruption Vulnerability
CVE-2020-17058 - Microsoft Browser Memory Corruption Vulnerability

Affected Products:
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for ARM64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 20H2 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems

Internet Explorer 11 on Windows 10 Version 2004 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 20H2 for x64-based Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows RT 8.1
Microsoft Edge (EdgeHTML-based) on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows Server 2012
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 2004 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 20H2 for 32-bit Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their November 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

MS20-NOV: Microsoft Windows Security Update High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their November 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-16970 - Azure Sphere Unsigned Code Execution Vulnerability
CVE-2020-16997 - Remote Desktop Protocol Server Information Disclosure Vulnerability
CVE-2020-16998 - DirectX Elevation of Privilege Vulnerability

CVE-2020-16999 - Windows WalletService Information Disclosure Vulnerability
CVE-2020-17000 - Remote Desktop Protocol Client Information Disclosure Vulnerability
CVE-2020-17001 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2020-17004 - Windows Graphics Component Information Disclosure Vulnerability
CVE-2020-17055 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17056 - Windows Network File System Information Disclosure Vulnerability
CVE-2020-17057 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2020-17068 - Windows GDI+ Remote Code Execution Vulnerability
CVE-2020-17069 - Windows NDIS Information Disclosure Vulnerability
CVE-2020-17070 - Windows Update Medic Service Elevation of Privilege Vulnerability
CVE-2020-17071 - Windows Delivery Optimization Information Disclosure Vulnerability
CVE-2020-17073 - Windows Update Orchestrator Service Elevation of Privilege Vulnerability
CVE-2020-17074 - Windows Update Orchestrator Service Elevation of Privilege Vulnerability
CVE-2020-17075 - Windows USO Core Worker Elevation of Privilege Vulnerability
CVE-2020-17076 - Windows Update Orchestrator Service Elevation of Privilege Vulnerability
CVE-2020-17077 - Windows Update Stack Elevation of Privilege Vulnerability
CVE-2020-17078 - Raw Image Extension Remote Code Execution Vulnerability
CVE-2020-17079 - Raw Image Extension Remote Code Execution Vulnerability
CVE-2020-17087 - Windows Kernel Local Elevation of Privilege Vulnerability
CVE-2020-17088 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2020-17090 - Microsoft Defender for Endpoint Security Feature Bypass Vulnerability
CVE-2020-17091 - Microsoft Teams Remote Code Execution Vulnerability
CVE-2020-17100 - Visual Studio Tampering Vulnerability
CVE-2020-17101 - HEIF Image Extensions Remote Code Execution Vulnerability
CVE-2020-17102 - WebP Image Extensions Information Disclosure Vulnerability
CVE-2020-17105 - AV1 Video Extension Remote Code Execution Vulnerability
CVE-2020-17106 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2020-17107 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2020-17108 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2020-17109 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2020-17110 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2020-17113 - Windows Camera Codec Information Disclosure Vulnerability
CVE-2020-1599 - Windows Spoofing Vulnerability
CVE-2020-16981 - Azure Sphere Elevation of Privilege Vulnerability
CVE-2020-16982 - Azure Sphere Unsigned Code Execution Vulnerability
CVE-2020-16983 - Azure Sphere Tampering Vulnerability
CVE-2020-16984 - Azure Sphere Unsigned Code Execution Vulnerability
CVE-2020-16985 - Azure Sphere Information Disclosure Vulnerability
CVE-2020-16986 - Azure Sphere Denial of Service Vulnerability
CVE-2020-16987 - Azure Sphere Unsigned Code Execution Vulnerability
CVE-2020-16988 - Azure Sphere Elevation of Privilege Vulnerability
CVE-2020-16989 - Azure Sphere Elevation of Privilege Vulnerability
CVE-2020-16990 - Azure Sphere Information Disclosure Vulnerability
CVE-2020-16991 - Azure Sphere Unsigned Code Execution Vulnerability
CVE-2020-16992 - Azure Sphere Elevation of Privilege Vulnerability
CVE-2020-16993 - Azure Sphere Elevation of Privilege Vulnerability
CVE-2020-16994 - Azure Sphere Unsigned Code Execution Vulnerability
CVE-2020-17005 - Microsoft Dynamics 365 (on-premises) Cross-site Scripting Vulnerability
CVE-2020-17006 - Microsoft Dynamics 365 (on-premises) Cross-site Scripting Vulnerability

CVE-2020-17007 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-17010 - Win32k Elevation of Privilege Vulnerability
CVE-2020-17011 - Windows Port Class Library Elevation of Privilege Vulnerability
CVE-2020-17012 - Windows Bind Filter Driver Elevation of Privilege Vulnerability
CVE-2020-17013 - Win32k Information Disclosure Vulnerability
CVE-2020-17014 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2020-17018 - Microsoft Dynamics 365 (on-premises) Cross-site Scripting Vulnerability
CVE-2020-17021 - Microsoft Dynamics 365 (on-premises) Cross-site Scripting Vulnerability
CVE-2020-17024 - Windows Client Side Rendering Print Provider Elevation of Privilege Vulnerability
CVE-2020-17025 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17026 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17027 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17028 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17029 - Windows Canonical Display Driver Information Disclosure Vulnerability
CVE-2020-17030 - Windows MSCTF Server Information Disclosure Vulnerability
CVE-2020-17031 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17032 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17033 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17034 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17035 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-17036 - Windows Function Discovery SSDP Provider Information Disclosure Vulnerability
CVE-2020-17037 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2020-17038 - Win32k Elevation of Privilege Vulnerability
CVE-2020-17040 - Windows Hyper-V Security Feature Bypass Vulnerability
CVE-2020-17041 - Windows Print Configuration Elevation of Privilege Vulnerability
CVE-2020-17042 - Windows Print Spooler Remote Code Execution Vulnerability
CVE-2020-17043 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17044 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2020-17045 - Windows KernelStream Information Disclosure Vulnerability
CVE-2020-17046 - Windows Error Reporting Denial of Service Vulnerability
CVE-2020-17047 - Windows Network File System Denial of Service Vulnerability
CVE-2020-17049 - Kerberos Security Feature Bypass Vulnerability
CVE-2020-17051 - Windows Network File System Remote Code Execution Vulnerability
CVE-2020-17081 - Microsoft Raw Image Extension Information Disclosure Vulnerability
CVE-2020-17082 - Raw Image Extension Remote Code Execution Vulnerability
CVE-2020-17086 - Raw Image Extension Remote Code Execution Vulnerability
CVE-2020-17104 - Visual Studio Code JSHint Extension Remote Code Execution Vulnerability
CVE-2020-1325 - Azure DevOps Server and Team Foundation Services Spoofing Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
HEIF Image Extension
HEVC Video Extensions
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)

Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2019
Microsoft Visual Studio 2019 version 16.0
Windows 10 Version 1803 for x64-based Systems
Raw Image Extension
Windows 8.1 for x64-based systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1903 for 32-bit Systems
Windows 10 Version 1803 for 32-bit Systems
WebP Image Extension
Microsoft Dynamics 365 (on-premises) version 8.2
Windows 10 Version 1903 for x64-based Systems
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 2004 for ARM64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
Windows Server, version 2004 (Server Core installation)
Windows 10 Version 1903 for ARM64-based Systems
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Azure Sphere
Windows 10 Version 1809 for x64-based Systems
Windows Server, version 20H2 (Server Core Installation)
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows Server, version 1909 (Server Core installation)
Microsoft Dynamics CRM 2015 (on-premises) version 7.0
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
AV1 Video Extension
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows 10 Version 1803 for ARM64-based Systems
Microsoft Visual Studio 2019 version 16.8
Windows Server 2019 (Server Core installation)

Windows Server 2016
Microsoft Teams
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Azure DevOps Server 2019 Update 1.1

CVSS Base Score: 9.8

MS20-NOV: Microsoft Windows Security Update - Registry Entry Not Set

High

Vulnerability Details

A security feature bypass vulnerability exists in the way Key Distribution Center (KDC) determines if a service ticket can be used for delegation via Kerberos Constrained Delegation (KCD). To exploit the vulnerability, a compromised service that is configured to use KCD could tamper with a service ticket that is not valid for delegation to force the KDC to accept it.

The Microsoft patch for this vulnerability has already been installed, however, the scanner has detected the registry changes required to fully remediate this vulnerability have not been set.
Impact:
An attacker could exploit this vulnerability to impersonate authenticated users or obtain Kerberos service tickets without proper authorization.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

The MS20-NOV patch has already been applied. By default, Windows servers have full mitigation for this vulnerability disabled. In order to fully remediate this vulnerability, a registry entry needs to be added.

Microsoft advises waiting at least a week to allow all outstanding Service for User to Self (S4U2self) Kerberos service tickets to expire. Then full protection can be enabled by adding the following registry key to enable Active Directory domain controller Enforcement mode .

Key: HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Kdc
Value: PerformTicketSignature = 2
Value Type: DWORD (Decimal value)

Note that Windows Server 2008 SP2 and Windows Server 2008 R2 require the MS20-DEC patch to be installed as well.

CVSS Base Score: 7.2

MS20-OCT: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their October 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-16863 - Windows Remote Desktop Service Denial of Service Vulnerability
CVE-2020-16876 - Windows Application Compatibility Client Library Elevation of Privilege Vulnerability
CVE-2020-16877 - Windows Elevation of Privilege Vulnerability
CVE-2020-16889 - Windows KernelStream Information Disclosure Vulnerability
CVE-2020-16890 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-16891 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2020-16892 - Windows Image Elevation of Privilege Vulnerability
CVE-2020-16894 - Windows NAT Remote Code Execution Vulnerability
CVE-2020-16895 - Windows Error Reporting Manager Elevation of Privilege Vulnerability
CVE-2020-16896 - Windows Remote Desktop Protocol (RDP) Information Disclosure Vulnerability
CVE-2020-16897 - NetBT Information Disclosure Vulnerability
CVE-2020-16904 - Azure Functions Elevation of Privilege Vulnerability
CVE-2020-16918 - Base3D Remote Code Execution Vulnerability
CVE-2020-16919 - Windows Enterprise App Management Service Information Disclosure Vulnerability
CVE-2020-16920 - Windows Application Compatibility Client Library Elevation of Privilege Vulnerability
CVE-2020-16921 - Windows Text Services Framework Information Disclosure Vulnerability
CVE-2020-16922 - Windows Spoofing Vulnerability
CVE-2020-16923 - Microsoft Graphics Components Remote Code Execution Vulnerability
CVE-2020-16924 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-16927 - Windows Remote Desktop Protocol (RDP) Denial of Service Vulnerability
CVE-2020-16935 - Windows COM Server Elevation of Privilege Vulnerability

CVE-2020-16938 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-16976 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-16977 - Visual Studio Code Python Extension Remote Code Execution Vulnerability
CVE-2020-16995 - Network Watcher Agent Virtual Machine Extension for Linux Elevation of Privilege Vulnerability
CVE-2020-17003 - Base3D Remote Code Execution Vulnerability
CVE-2020-0764 - Windows Storage Services Elevation of Privilege Vulnerability
CVE-2020-1047 - Windows Hyper-V Elevation of Privilege Vulnerability
CVE-2020-1080 - Windows Hyper-V Elevation of Privilege Vulnerability
CVE-2020-1167 - Microsoft Graphics Components Remote Code Execution Vulnerability
CVE-2020-1243 - Windows Hyper-V Denial of Service Vulnerability
CVE-2020-16885 - Windows Storage VSP Driver Elevation of Privilege Vulnerability
CVE-2020-16886 - PowerShellGet Module WDAC Security Feature Bypass Vulnerability
CVE-2020-16887 - Windows Network Connections Service Elevation of Privilege Vulnerability
CVE-2020-16898 - Windows TCP/IP Remote Code Execution Vulnerability
CVE-2020-16899 - Windows TCP/IP Denial of Service Vulnerability
CVE-2020-16900 - Windows Event System Elevation of Privilege Vulnerability
CVE-2020-16901 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-16902 - Windows Installer Elevation of Privilege Vulnerability
CVE-2020-16905 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-16907 - Win32k Elevation of Privilege Vulnerability
CVE-2020-16908 - Windows Setup Elevation of Privilege Vulnerability
CVE-2020-16909 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2020-16910 - Windows Security Feature Bypass Vulnerability
CVE-2020-16911 - GDI+ Remote Code Execution Vulnerability
CVE-2020-16912 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-16913 - Win32k Elevation of Privilege Vulnerability
CVE-2020-16914 - Windows GDI+ Information Disclosure Vulnerability
CVE-2020-16915 - Media Foundation Memory Corruption Vulnerability
CVE-2020-16916 - Windows COM Server Elevation of Privilege Vulnerability
CVE-2020-16936 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-16939 - Group Policy Elevation of Privilege Vulnerability
CVE-2020-16940 - Windows - User Profile Service Elevation of Privilege Vulnerability
CVE-2020-16943 - Dynamics 365 Commerce Elevation of Privilege Vulnerability
CVE-2020-16956 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-16967 - Windows Camera Codec Pack Remote Code Execution Vulnerability
CVE-2020-16968 - Windows Camera Codec Pack Remote Code Execution Vulnerability
CVE-2020-16972 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-16973 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-16974 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-16975 - Windows Backup Service Elevation of Privilege Vulnerability
CVE-2020-16978 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-16980 - Windows iSCSI Target Service Elevation of Privilege Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems

Windows Server, version 1903 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft 365 Apps for Enterprise for 32-bit Systems
Windows Server 2012 (Server Core installation)
Microsoft 365 Apps for Enterprise for 64-bit Systems
Windows Server 2012
Windows Server 2019
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Windows 10 Version 1803 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows 10 Version 1709 for x64-based Systems
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows Server, version 1909 (Server Core installation)
Dynamics 365 Commerce
Azure Functions
Windows 10 Version 1909 for x64-based Systems
PowerShellGet 2.2.5
Windows 10 Version 1903 for 32-bit Systems
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
Windows 10 Version 1803 for 32-bit Systems
Network Watcher Agent virtual machine extension for Linux
Microsoft Dynamics 365 (on-premises) version 8.2
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 1903 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows 10 Version 1709 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1709 for ARM64-based Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
Windows 10 Version 1803 for ARM64-based Systems
Windows Server, version 2004 (Server Core installation)
Windows 10 Version 1903 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016

Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
3D Viewer

False Positive Notes

MS20-SEP: Microsoft Internet Explorer Security Update — High

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2020-1506 - Windows Start-Up Application Elevation of Privilege Vulnerability
CVE-2020-0878 - Microsoft Browser Memory Corruption Vulnerability
CVE-2020-1012 - WinINet API Elevation of Privilege Vulnerability

Affected Products:
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems

Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for ARM64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for x64-based Systems
ChakraCore
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1903 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 2004 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows RT 8.1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2019
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2012
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2

Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 2004 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for x64-based Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their September 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

CVSS Base Score: 8.8

CVSS Vector: AV:N/AC:L/PR:N/UI:R/S:U/C:H/I:H/A:H

MS20-SEP: Microsoft Windows Security Update High

Solution Details

Microsoft has released a fix for this flaw in their September 2020 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-1532 - Windows InstallService Elevation of Privilege Vulnerability
CVE-2020-16856 - Visual Studio Remote Code Execution Vulnerability
CVE-2020-16857 - Microsoft Dynamics 365 for Finance and Operations (on-premises) Remote Code Execution Vulnerability
CVE-2020-16858 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-16859 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-16860 - Microsoft Dynamics 365 (on-premises) Remote Code Execution Vulnerability
CVE-2020-16861 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-16862 - Microsoft Dynamics 365 (on-premises) Remote Code Execution Vulnerability
CVE-2020-16864 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-16872 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-16878 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-16879 - Projected Filesystem Information Disclosure Vulnerability
CVE-2020-16881 - Visual Studio JSON Remote Code Execution Vulnerability
CVE-2020-1376 - Windows Elevation of Privilege Vulnerability
CVE-2020-1471 - Windows CloudExperienceHost Elevation of Privilege Vulnerability
CVE-2020-1491 - Windows Function Discovery Service Elevation of Privilege Vulnerability
CVE-2020-1507 - Microsoft COM for Windows Elevation of Privilege Vulnerability
CVE-2020-1508 - Windows Media Audio Decoder Remote Code Execution Vulnerability
CVE-2020-1559 - Windows Storage Services Elevation of Privilege Vulnerability
CVE-2020-1589 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1590 - Connected User Experiences and Telemetry Service Elevation of Privilege Vulnerability
CVE-2020-1592 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1593 - Windows Media Audio Decoder Remote Code Execution Vulnerability
CVE-2020-1596 - TLS Information Disclosure Vulnerability

CVE-2020-1598 - Windows UPnP Service Elevation of Privilege Vulnerability
CVE-2020-0648 - Windows RSoP Service Application Elevation of Privilege Vulnerability
CVE-2020-0664 - Active Directory Information Disclosure Vulnerability
CVE-2020-0718 - Active Directory Remote Code Execution Vulnerability
CVE-2020-0761 - Active Directory Remote Code Execution Vulnerability
CVE-2020-0766 - Microsoft Store Runtime Elevation of Privilege Vulnerability
CVE-2020-0782 - Windows Cryptographic Catalog Services Elevation of Privilege Vulnerability
CVE-2020-0790 - Microsoft splwow64 Elevation of Privilege Vulnerability
CVE-2020-0805 - Projected Filesystem Security Feature Bypass Vulnerability
CVE-2020-0836 - Windows DNS Denial of Service Vulnerability
CVE-2020-0837 - ADFS Spoofing Vulnerability
CVE-2020-0838 - NTFS Elevation of Privilege Vulnerability
CVE-2020-0839 - Windows dnsrslvr.dll Elevation of Privilege Vulnerability
CVE-2020-0856 - Active Directory Information Disclosure Vulnerability
CVE-2020-0870 - Shell infrastructure component Elevation of Privilege Vulnerability
CVE-2020-0875 - Microsoft splwow64 Information Disclosure Vulnerability
CVE-2020-0886 - Windows Storage Services Elevation of Privilege Vulnerability
CVE-2020-0890 - Windows Hyper-V Denial of Service Vulnerability
CVE-2020-0904 - Windows Hyper-V Denial of Service Vulnerability
CVE-2020-0908 - Windows Text Service Module Remote Code Execution Vulnerability
CVE-2020-0911 - Windows Modules Installer Elevation of Privilege Vulnerability
CVE-2020-0912 - Windows Function Discovery SSDP Provider Elevation of Privilege Vulnerability
CVE-2020-0914 - Windows State Repository Service Information Disclosure Vulnerability
CVE-2020-0921 - Microsoft Graphics Component Information Disclosure Vulnerability
CVE-2020-0922 - Microsoft COM for Windows Remote Code Execution Vulnerability
CVE-2020-0928 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-0941 - Win32k Information Disclosure Vulnerability
CVE-2020-0951 - Windows Defender Application Control Security Feature Bypass Vulnerability
CVE-2020-0989 - Windows Mobile Device Management Diagnostics Information Disclosure Vulnerability
CVE-2020-0997 - Windows Camera Codec Pack Remote Code Execution Vulnerability
CVE-2020-0998 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2020-1013 - Group Policy Elevation of Privilege Vulnerability
CVE-2020-1030 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2020-1031 - Windows DHCP Server Information Disclosure Vulnerability
CVE-2020-1033 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-1034 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2020-1038 - Windows Routing Utilities Denial of Service
CVE-2020-1039 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1045 - Microsoft ASP.NET Core Security Feature Bypass Vulnerability
CVE-2020-1052 - Windows Elevation of Privilege Vulnerability
CVE-2020-1053 - DirectX Elevation of Privilege Vulnerability
CVE-2020-1074 - Jet Database Engine Remote Code Execution Vulnerability
CVE-2020-1083 - Microsoft Graphics Component Information Disclosure Vulnerability
CVE-2020-1091 - Windows Graphics Component Information Disclosure Vulnerability
CVE-2020-1097 - Windows Graphics Component Information Disclosure Vulnerability
CVE-2020-1098 - Windows Shell Infrastructure Component Elevation of Privilege Vulnerability
CVE-2020-1115 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2020-1119 - Windows Information Disclosure Vulnerability
CVE-2020-1122 - Windows Language Pack Installer Elevation of Privilege Vulnerability

CVE-2020-1129 - Microsoft Windows Codecs Library Remote Code Execution Vulnerability
CVE-2020-1130 - Diagnostics Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2020-1133 - Diagnostics Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2020-1146 - Microsoft Store Runtime Elevation of Privilege Vulnerability
CVE-2020-1152 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2020-1159 - Windows Elevation of Privilege Vulnerability
CVE-2020-1169 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1228 - Windows DNS Denial of Service Vulnerability
CVE-2020-1245 - Win32k Elevation of Privilege Vulnerability
CVE-2020-1250 - Win32k Information Disclosure Vulnerability
CVE-2020-1252 - Windows Remote Code Execution Vulnerability
CVE-2020-1256 - Windows GDI Information Disclosure Vulnerability
CVE-2020-1285 - GDI+ Remote Code Execution Vulnerability
CVE-2020-1303 - Windows Runtime Elevation of Privilege Vulnerability
CVE-2020-1308 - DirectX Elevation of Privilege Vulnerability
CVE-2020-1319 - Microsoft Windows Codecs Library Remote Code Execution Vulnerability
CVE-2020-16851 - OneDrive for Windows Elevation of Privilege Vulnerability
CVE-2020-16852 - OneDrive for Windows Elevation of Privilege Vulnerability
CVE-2020-16853 - OneDrive for Windows Elevation of Privilege Vulnerability
CVE-2020-16854 - Windows Kernel Information Disclosure Vulnerability
CVE-2020-16871 - Microsoft Dynamics 365 (On-Premise) Cross Site Scripting Vulnerability
CVE-2020-16873 - Xamarin.Forms Spoofing Vulnerability
CVE-2020-16874 - Visual Studio Remote Code Execution Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows Server, version 1903 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2019
Microsoft Visual Studio 2019 version 16.0
Windows 10 Version 1803 for x64-based Systems
Windows 8.1 for x64-based systems
Microsoft Visual Studio 2012 Update 5
OneDrive for Windows
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1903 for 32-bit Systems
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 1607 for x64-based Systems
Microsoft Dynamics 365 (on-premises) version 8.2
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1903 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems

Windows 10 Version 1709 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 2004 for ARM64-based Systems
Microsoft Visual Studio 2015 Update 3
xamarin.forms
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows Server, version 2004 (Server Core installation)
Windows 10 Version 1903 for ARM64-based Systems
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows 10 Version 1809 for x64-based Systems
ASP.NET Core 2.1
Dynamics 365 for Finance and Operations
Windows Server 2012
Microsoft Visual Studio 2013 Update 5
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows 10 Version 1709 for x64-based Systems
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
ASP.NET Core 3.1
Windows Server, version 1909 (Server Core installation)
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
Windows 10 Version 1709 for ARM64-based Systems
Windows Server, version 1803 (Server Core Installation)
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows 10 Version 1803 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

MS21-APR: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their April 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-27067 - Azure DevOps Server and Team Foundation Server Information Disclosure

Vulnerability
CVE-2021-27072 - Win32k Elevation of Privilege Vulnerability
CVE-2021-27079 - Windows Media Photo Codec Information Disclosure Vulnerability
CVE-2021-27088 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-27089 - Microsoft Internet Messaging API Remote Code Execution Vulnerability
CVE-2021-27090 - Windows Secure Kernel Mode Elevation of Privilege Vulnerability
CVE-2021-27091 - RPC Endpoint Mapper Service Elevation of Privilege Vulnerability
CVE-2021-27092 - Azure AD Web Sign-in Security Feature Bypass Vulnerability
CVE-2021-27093 - Windows Kernel Information Disclosure Vulnerability
CVE-2021-27094 - Windows Early Launch Antimalware Driver Security Feature Bypass Vulnerability
CVE-2021-27095 - Windows Media Video Decoder Remote Code Execution Vulnerability
CVE-2021-27096 - NTFS Elevation of Privilege Vulnerability
CVE-2021-26413 - Windows Installer Spoofing Vulnerability
CVE-2021-26415 - Windows Installer Elevation of Privilege Vulnerability
CVE-2021-26416 - Windows Hyper-V Denial of Service Vulnerability
CVE-2021-26417 - Windows Overlay Filter Information Disclosure Vulnerability
CVE-2021-28309 - Windows Kernel Information Disclosure Vulnerability
CVE-2021-28310 - Win32k Elevation of Privilege Vulnerability
CVE-2021-28311 - Windows Application Compatibility Cache Denial of Service Vulnerability
CVE-2021-28312 - Windows NTFS Denial of Service Vulnerability
CVE-2021-28313 - Diagnostics Hub Standard Collector Service Elevation of Privilege Vulnerability
CVE-2021-28314 - Windows Hyper-V Elevation of Privilege Vulnerability
CVE-2021-28315 - Windows Media Video Decoder Remote Code Execution Vulnerability
CVE-2021-28316 - Windows WLAN AutoConfig Service Security Feature Bypass Vulnerability
CVE-2021-28317 - Microsoft Windows Codecs Library Information Disclosure Vulnerability
CVE-2021-28318 - Windows GDI+ Information Disclosure Vulnerability
CVE-2021-28319 - Windows TCP/IP Driver Denial of Service Vulnerability
CVE-2021-28320 - Windows Resource Manager PSM Service Extension Elevation of Privilege Vulnerability
CVE-2021-28321 - Diagnostics Hub Standard Collector Service Elevation of Privilege Vulnerability
CVE-2021-28322 - Diagnostics Hub Standard Collector Service Elevation of Privilege Vulnerability
CVE-2021-28323 - Windows DNS Information Disclosure Vulnerability
CVE-2021-28324 - Windows SMB Information Disclosure Vulnerability
CVE-2021-28325 - Windows SMB Information Disclosure Vulnerability
CVE-2021-28326 - Windows AppX Deployment Server Denial of Service Vulnerability
CVE-2021-28327 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28328 - Windows DNS Information Disclosure Vulnerability
CVE-2021-28329 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28330 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28331 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28332 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28333 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28334 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28335 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28336 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28337 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28338 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28339 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28340 - Remote Procedure Call Runtime Remote Code Execution Vulnerability

CVE-2021-28341 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28342 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28343 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28344 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28345 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28346 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28347 - Windows Speech Runtime Elevation of Privilege Vulnerability
CVE-2021-28348 - Windows GDI+ Remote Code Execution Vulnerability
CVE-2021-28349 - Windows GDI+ Remote Code Execution Vulnerability
CVE-2021-28350 - Windows GDI+ Remote Code Execution Vulnerability
CVE-2021-28351 - Windows Speech Runtime Elevation of Privilege Vulnerability
CVE-2021-28352 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28353 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28354 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28355 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28356 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28357 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28358 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28434 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-28435 - Windows Event Tracing Information Disclosure Vulnerability
CVE-2021-28436 - Windows Speech Runtime Elevation of Privilege Vulnerability
CVE-2021-28437 - Windows Installer Information Disclosure Vulnerability
CVE-2021-28438 - Windows Console Driver Denial of Service Vulnerability
CVE-2021-28439 - Windows TCP/IP Driver Denial of Service Vulnerability
CVE-2021-28440 - Windows Installer Elevation of Privilege Vulnerability
CVE-2021-28441 - Windows Hyper-V Information Disclosure Vulnerability
CVE-2021-28442 - Windows TCP/IP Information Disclosure Vulnerability
CVE-2021-28443 - Windows Console Driver Denial of Service Vulnerability
CVE-2021-28444 - Windows Hyper-V Security Feature Bypass Vulnerability
CVE-2021-28445 - Windows Network File System Remote Code Execution Vulnerability
CVE-2021-28446 - Windows Portmapping Information Disclosure Vulnerability
CVE-2021-28447 - Windows Early Launch Antimalware Driver Security Feature Bypass Vulnerability
CVE-2021-28448 - Visual Studio Code Kubernetes Tools Remote Code Execution Vulnerability
CVE-2021-28457 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-28458 - Azure ms-rest-nodeauth Library Elevation of Privilege Vulnerability
CVE-2021-28459 - Azure DevOps Server Spoofing Vulnerability
CVE-2021-28460 - Azure Sphere Unsigned Code Execution Vulnerability
CVE-2021-28469 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-28470 - Visual Studio Code GitHub Pull Requests and Issues Extension Remote Code Execution Vulnerability
CVE-2021-28471 - Remote Development Extension for Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-28472 - Visual Studio Code Maven for Java Extension Remote Code Execution Vulnerability
CVE-2021-28475 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-28477 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-27064 - Visual Studio Installer Elevation of Privilege Vulnerability
CVE-2021-27086 - Windows Services and Controller App Elevation of Privilege Vulnerability
CVE-2021-28464 - VP9 Video Extensions Remote Code Execution Vulnerability
CVE-2021-28466 - Raw Image Extension Remote Code Execution Vulnerability

CVE-2021-28468 - Raw Image Extension Remote Code Execution Vulnerability
CVE-2021-28473 - Visual Studio Code Remote Code Execution Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2019
Windows 10 Version 1803 for x64-based Systems
Raw Image Extension
Windows 8.1 for x64-based systems
Windows 10 Version 20H2 for ARM64-based Systems
Azure DevOps Server 2020.0.1
@azure/ms-rest-nodeauth
Windows 10 Version 1909 for x64-based Systems
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Azure DevOps Server 2019 Update 1
Windows 10 Version 1803 for 32-bit Systems
Team Foundation Server 2018 Update 3.2
Visual Studio Code - Kubernetes Tools
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Azure DevOps Server 2019.0.1
Windows 10 Version 2004 for ARM64-based Systems
Microsoft Visual Studio 2015 Update 3
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
VP9 Video Extensions
Windows Server, version 2004 (Server Core installation)
Azure Sphere
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows 10 Version 1809 for x64-based Systems
Azure DevOps Server 2020
Windows Server, version 20H2 (Server Core Installation)
Visual Studio Code - GitHub Pull Requests and Issues Extension
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)

Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows Server, version 1909 (Server Core installation)
Visual Studio Code - Maven for Java Extension
Team Foundation Server 2017 Update 3.1
Windows 10 Version 1909 for ARM64-based Systems
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Team Foundation Server 2018 Update 1.2
Windows Server 2019 (Server Core installation)
Windows Server 2016
Team Foundation Server 2015 Update 4.2
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Azure DevOps Server 2019 Update 1.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS21-AUG: Microsoft Internet Explorer Security Update High

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2021-34480 - Scripting Engine Memory Corruption Vulnerability

Affected Products:
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 1909 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows 10 Version 21H1 for 32-bit Systems
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2019
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1

Windows 10 for x64-based Systems
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows Server 2016
Windows 8.1 for 32-bit systems
Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 21H1 for ARM64-based Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their August 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

CVSS Base Score: 8.8

CVSS Vector: AV:N/AC:L/PR:N/UI:R/S:U/C:H/I:H/A:H

MS21-AUG: Microsoft Windows Security Update — High

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-33762 - Azure CycleCloud Elevation of Privilege Vulnerability
CVE-2021-34524 - Microsoft Dynamics 365 (on-premises) Remote Code Execution Vulnerability
CVE-2021-34480 - Scripting Engine Memory Corruption Vulnerability
CVE-2021-34486 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-34536 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-34487 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-34537 - Windows Bluetooth Driver Elevation of Privilege Vulnerability
CVE-2021-26423 - .NET Core and Visual Studio Denial of Service Vulnerability
CVE-2021-26424 - Windows TCP/IP Remote Code Execution Vulnerability
CVE-2021-26425 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-26426 - Windows User Account Profile Picture Elevation of Privilege Vulnerability
CVE-2021-26428 - Azure Sphere Information Disclosure Vulnerability
CVE-2021-26429 - Azure Sphere Elevation of Privilege Vulnerability
CVE-2021-26430 - Azure Sphere Denial of Service Vulnerability
CVE-2021-36936 - Windows Print Spooler Remote Code Execution Vulnerability
CVE-2021-36937 - Windows Media MPEG-4 Video Decoder Remote Code Execution Vulnerability
CVE-2021-36938 - Windows Cryptographic Primitives Library Information Disclosure Vulnerability
CVE-2021-36942 - Windows LSA Spoofing Vulnerability
CVE-2021-36945 - Windows 10 Update Assistant Elevation of Privilege Vulnerability
CVE-2021-36946 - Microsoft Dynamics Business Central Cross-site Scripting Vulnerability
CVE-2021-36947 - Windows Print Spooler Remote Code Execution Vulnerability
CVE-2021-36948 - Windows Update Medic Service Elevation of Privilege Vulnerability
CVE-2021-36949 - Microsoft Azure Active Directory Connect Authentication Bypass Vulnerability
CVE-2021-36950 - Microsoft Dynamics 365 (on-premises) Cross-site Scripting Vulnerability
CVE-2021-34471 - Microsoft Windows Defender Elevation of Privilege Vulnerability
CVE-2021-34530 - Windows Graphics Component Remote Code Execution Vulnerability
CVE-2021-34532 - ASP.NET Core and Visual Studio Information Disclosure Vulnerability
CVE-2021-34533 - Windows Graphics Component Font Parsing Remote Code Execution Vulnerability
CVE-2021-34483 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2021-34484 - Windows User Profile Service Elevation of Privilege Vulnerability
CVE-2021-34485 - .NET Core and Visual Studio Information Disclosure Vulnerability
CVE-2021-34535 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2021-26431 - Windows Recovery Environment Agent Elevation of Privilege Vulnerability
CVE-2021-26432 - Windows Services for NFS ONCRPC XDR Driver Remote Code Execution Vulnerability
CVE-2021-26433 - Windows Services for NFS ONCRPC XDR Driver Information Disclosure Vulnerability
CVE-2021-36926 - Windows Services for NFS ONCRPC XDR Driver Information Disclosure Vulnerability
CVE-2021-36927 - Windows Digital TV Tuner device registration application Elevation of Privilege Vulnerability
CVE-2021-36932 - Windows Services for NFS ONCRPC XDR Driver Information Disclosure Vulnerability
CVE-2021-36933 - Windows Services for NFS ONCRPC XDR Driver Information Disclosure Vulnerability
CVE-2021-36943 - Azure CycleCloud Elevation of Privilege Vulnerability
CVE-2021-30590 - Chromium: CVE-2021-30590 Heap buffer overflow in Bookmarks
CVE-2021-30591 - Chromium: CVE-2021-30591 Use after free in File System API
CVE-2021-30592 - Chromium: CVE-2021-30592 Out of bounds write in Tab Groups
CVE-2021-30593 - Chromium: CVE-2021-30593 Out of bounds read in Tab Strip
CVE-2021-30594 - Chromium: CVE-2021-30594 Use after free in Page Info UI
CVE-2021-30596 - Chromium: CVE-2021-30596 Incorrect security UI in Navigation
CVE-2021-30597 - Chromium: CVE-2021-30597 Use after free in Browser UI

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Microsoft Azure Active Directory Connect 2.0.3.0
Windows Server 2012 (Server Core installation)
Dynamics 365 Business Central 2019 Spring Update
Windows Server 2019
.NET 5.0
Windows 8.1 for x64-based systems
Visual Studio 2019 for Mac version 8.10
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Remote Desktop client for Windows Desktop
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Microsoft Dynamics 365 (on-premises) version 9.1
Windows 10 Version 2004 for ARM64-based Systems
Azure CycleCloud 7.9.10
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
Windows Server, version 2004 (Server Core installation)
Azure Sphere
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 21H1 for ARM64-based Systems
ASP.NET Core 2.1
Windows Server, version 20H2 (Server Core Installation)
Microsoft Malware Protection Engine
Microsoft Edge (Chromium-based)
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Azure CycleCloud 8.2.0
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Dynamics 365 Business Central 2020 Release Wave 2 - Update 17.9
Windows Server 2012 R2 (Server Core installation)
Windows Update Assistant
Windows Server 2012 R2

Windows 8.1 for 32-bit systems
ASP.NET Core 3.1
Microsoft Azure Active Directory Connect 1.6.4.0
Microsoft Visual Studio 2019 version 16.10 (includes 16.0 - 16.9)
.NET Core 3.1
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
.NET Core 2.1
Microsoft Dynamics NAV 2018
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Microsoft Dynamics NAV 2017
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Server 2019 (Server Core installation)
ASP.NET Core 5.0
Windows Server 2016
Microsoft Dynamics 365 Business Central 2020 Release Wave 1 - Update 16.15
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

MS21-DEC: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their December 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-40441 - Windows Media Center Elevation of Privilege Vulnerability

CVE-2021-40452 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-40453 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-42310 - Microsoft Defender for IoT Remote Code Execution Vulnerability
CVE-2021-42311 - Microsoft Defender for IoT Remote Code Execution Vulnerability
CVE-2021-42312 - Microsoft Defender for IOT Elevation of Privilege Vulnerability
CVE-2021-42313 - Microsoft Defender for IoT Remote Code Execution Vulnerability
CVE-2021-42314 - Microsoft Defender for IoT Remote Code Execution Vulnerability
CVE-2021-42315 - Microsoft Defender for IoT Remote Code Execution Vulnerability
CVE-2021-43214 - Web Media Extensions Remote Code Execution Vulnerability
CVE-2021-43215 - iSNS Server Memory Corruption Vulnerability Can Lead to Remote Code Execution
CVE-2021-43216 - Microsoft Local Security Authority Server (lsasrv) Information Disclosure Vulnerability
CVE-2021-43217 - Windows Encrypting File System (EFS) Remote Code Execution Vulnerability
CVE-2021-43219 - DirectX Graphics Kernel File Denial of Service Vulnerability
CVE-2021-43222 - Microsoft Message Queuing Information Disclosure Vulnerability
CVE-2021-43223 - Windows Remote Access Connection Manager Elevation of Privilege Vulnerability
CVE-2021-43224 - Windows Common Log File System Driver Information Disclosure Vulnerability
CVE-2021-43225 - Bot Framework SDK Remote Code Execution Vulnerability
CVE-2021-43226 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2021-43227 - Storage Spaces Controller Information Disclosure Vulnerability
CVE-2021-43228 - SymCrypt Denial of Service Vulnerability
CVE-2021-43229 - Windows NTFS Elevation of Privilege Vulnerability
CVE-2021-43230 - Windows NTFS Elevation of Privilege Vulnerability
CVE-2021-43231 - Windows NTFS Elevation of Privilege Vulnerability
CVE-2021-43232 - Windows Event Tracing Remote Code Execution Vulnerability
CVE-2021-43233 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2021-43234 - Windows Fax Service Remote Code Execution Vulnerability
CVE-2021-43235 - Storage Spaces Controller Information Disclosure Vulnerability
CVE-2021-43236 - Microsoft Message Queuing Information Disclosure Vulnerability
CVE-2021-43237 - Windows Setup Elevation of Privilege Vulnerability
CVE-2021-43238 - Windows Remote Access Elevation of Privilege Vulnerability
CVE-2021-43239 - Windows Recovery Environment Agent Elevation of Privilege Vulnerability
CVE-2021-43240 - NTFS Set Short Name Elevation of Privilege Vulnerability
CVE-2021-43243 - VP9 Video Extensions Information Disclosure Vulnerability
CVE-2021-43244 - Windows Kernel Information Disclosure Vulnerability
CVE-2021-43245 - Windows Digital TV Tuner Elevation of Privilege Vulnerability
CVE-2021-43246 - Windows Hyper-V Denial of Service Vulnerability
CVE-2021-43247 - Windows TCP/IP Driver Elevation of Privilege Vulnerability
CVE-2021-43248 - Windows Digital Media Receiver Elevation of Privilege Vulnerability
CVE-2021-43877 - ASP.NET Core and Visual Studio Elevation of Privilege Vulnerability
CVE-2021-43882 - Microsoft Defender for IoT Remote Code Execution Vulnerability
CVE-2021-43888 - Microsoft Defender for IoT Information Disclosure Vulnerability
CVE-2021-43889 - Microsoft Defender for IoT Remote Code Execution Vulnerability
CVE-2021-43891 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-43899 - Microsoft 4K Wireless Display Adapter Remote Code Execution Vulnerability
CVE-2021-43907 - Visual Studio Code WSL Extension Remote Code Execution Vulnerability
CVE-2021-41333 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2021-41360 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-41365 - Microsoft Defender for IoT Remote Code Execution Vulnerability
CVE-2021-43207 - Windows Common Log File System Driver Elevation of Privilege Vulnerability

CVE-2021-43880 - Windows Mobile Device Management Elevation of Privilege Vulnerability
CVE-2021-43883 - Windows Installer Elevation of Privilege Vulnerability
CVE-2021-43890 - Windows AppX Installer Spoofing Vulnerability
CVE-2021-43892 - Microsoft BizTalk ESB Toolkit Spoofing Vulnerability
CVE-2021-43893 - Windows Encrypting File System (EFS) Elevation of Privilege Vulnerability
CVE-2021-43896 - Microsoft PowerShell Spoofing Vulnerability
CVE-2021-43908 - Visual Studio Code Spoofing Vulnerability
CVE-2021-4052 - Chromium: CVE-2021-4052 Use after free in web apps
CVE-2021-4053 - Chromium: CVE-2021-4053 Use after free in UI
CVE-2021-4054 - Chromium: CVE-2021-4054 Incorrect security UI in autofill
CVE-2021-4055 - Chromium: CVE-2021-4055 Heap buffer overflow in extensions
CVE-2021-4056 - Chromium: CVE-2021-4056: Type Confusion in loader
CVE-2021-4057 - Chromium: CVE-2021-4057 Use after free in file API
CVE-2021-4058 - Chromium: CVE-2021-4058 Heap buffer overflow in ANGLE
CVE-2021-4059 - Chromium: CVE-2021-4059 Insufficient data validation in loader
CVE-2021-4061 - Chromium: CVE-2021-4061 Type Confusion in V8
CVE-2021-4062 - Chromium: CVE-2021-4062 Heap buffer overflow in BFCache
CVE-2021-4063 - Chromium: CVE-2021-4063 Use after free in developer tools
CVE-2021-4064 - Chromium: CVE-2021-4064 Use after free in screen capture
CVE-2021-4065 - Chromium: CVE-2021-4065 Use after free in autofill
CVE-2021-4066 - Chromium: CVE-2021-4066 Integer underflow in ANGLE
CVE-2021-4067 - Chromium: CVE-2021-4067 Use after free in window manager
CVE-2021-4068 - Chromium: CVE-2021-4068 Insufficient validation of untrusted input in new tab page
CVE-2021-4098 - Chromium: CVE-2021-4098 Insufficient data validation in Mojo
CVE-2021-4099 - Chromium: CVE-2021-4099 Use after free in Swiftshader
CVE-2021-4100 - Chromium: CVE-2021-4100 Object lifecycle issue in ANGLE
CVE-2021-4101 - Chromium: CVE-2021-4101 Heap buffer overflow in Swiftshader
CVE-2021-4102 - Chromium: CVE-2021-4102 Use after free in V8

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
HEVC Video Extensions
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
ASP.NET Core 6.0
Windows Server 2012 (Server Core installation)
Windows Server 2022 (Server Core installation)
Windows Server 2019
Visual Studio Code WSL Extension
Microsoft BizTalk ESB Toolkit 2.2
Raw Image Extension
Windows 8.1 for x64-based systems
Bot Framework SDK for .NET Framework
Windows 10 Version 21H2 for ARM64-based Systems

Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 11 for x64-based Systems
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
App Installer
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft Defender for IoT
VP9 Video Extensions
Windows Server, version 2004 (Server Core installation)
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows 10 Version 1809 for x64-based Systems
Microsoft BizTalk ESB Toolkit 2.4
Windows 10 Version 21H1 for ARM64-based Systems
Windows Server, version 20H2 (Server Core Installation)
Microsoft Edge (Chromium-based)
Windows 10 Version 21H2 for x64-based Systems
Windows Server 2022
Microsoft Visual Studio 2022 version 17.0
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
PowerShell 7.2
Windows 8.1 for 32-bit systems
ASP.NET Core 3.1
Windows 10 Version 21H2 for 32-bit Systems
Windows 10 Version 1909 for ARM64-based Systems
Windows 11 for ARM64-based Systems
Microsoft BizTalk ESB Toolkit 2.3
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Microsoft Visual Studio 2019 version 16.11 (includes 16.0 - 16.10)
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
ASP.NET Core 5.0
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft 4K Wireless Display Adapter

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 9.8

MS21-FEB: Microsoft Windows Security Update

High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their February 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-1639 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-1721 - .NET Core and Visual Studio Denial of Service Vulnerability
CVE-2021-1724 - Microsoft Dynamics Business Central Cross-site Scripting Vulnerability
CVE-2021-1728 - System Center Operations Manager Elevation of Privilege Vulnerability
CVE-2021-1731 - PFX Encryption Security Feature Bypass Vulnerability
CVE-2021-1732 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2021-1733 - Sysinternals PsExec Elevation of Privilege Vulnerability
CVE-2021-1734 - Windows Remote Procedure Call Information Disclosure Vulnerability
CVE-2021-1698 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2021-1722 - Windows Fax Service Remote Code Execution Vulnerability
CVE-2021-25195 - Windows PKU2U Elevation of Privilege Vulnerability
CVE-2021-24087 - Azure IoT CLI extension Elevation of Privilege Vulnerability
CVE-2021-24093 - Windows Graphics Component Remote Code Execution Vulnerability
CVE-2021-24096 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-24101 - Microsoft Dataverse Information Disclosure Vulnerability
CVE-2021-24112 - .NET Core Remote Code Execution Vulnerability
CVE-2021-26700 - Visual Studio Code npm-script Extension Remote Code Execution Vulnerability
CVE-2021-26701 - .NET Core Remote Code Execution Vulnerability
CVE-2021-24114 - Microsoft Teams iOS Information Disclosure Vulnerability
CVE-2021-1727 - Windows Installer Elevation of Privilege Vulnerability
CVE-2021-24074 - Windows TCP/IP Remote Code Execution Vulnerability
CVE-2021-24075 - Windows Network File System Denial of Service Vulnerability
CVE-2021-24076 - Microsoft Windows VMSwitch Information Disclosure Vulnerability
CVE-2021-24077 - Windows Fax Service Remote Code Execution Vulnerability
CVE-2021-24078 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-24079 - Windows Backup Engine Information Disclosure Vulnerability
CVE-2021-24080 - Windows Trust Verification API Denial of Service Vulnerability
CVE-2021-24081 - Microsoft Windows Codecs Library Remote Code Execution Vulnerability
CVE-2021-24082 - Microsoft.PowerShell.Utility Module WDAC Security Feature Bypass Vulnerability
CVE-2021-24083 - Windows Address Book Remote Code Execution Vulnerability
CVE-2021-24084 - Windows Mobile Device Management Information Disclosure Vulnerability
CVE-2021-24086 - Windows TCP/IP Denial of Service Vulnerability
CVE-2021-24088 - Windows Local Spooler Remote Code Execution Vulnerability

CVE-2021-24091 - Windows Camera Codec Pack Remote Code Execution Vulnerability
CVE-2021-24092 - Microsoft Defender Elevation of Privilege Vulnerability
CVE-2021-24094 - Windows TCP/IP Remote Code Execution Vulnerability
CVE-2021-24098 - Windows Console Driver Denial of Service Vulnerability
CVE-2021-24102 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-24103 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-24105 - Package Managers Configurations Remote Code Execution Vulnerability
CVE-2021-24106 - Windows DirectX Information Disclosure Vulnerability
CVE-2021-24109 - Microsoft Azure Kubernetes Service Elevation of Privilege Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows Defender on Windows Server 2019
Windows Defender on Windows Server 2012
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Microsoft Dynamics 365 Business Central 2020 Release Wave 1
Windows 10 Version 20H2 for 32-bit Systems
Windows Defender on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Defender on Windows 10 Version 1803 for ARM64-based Systems
Windows Server 2019
Windows Defender on Windows Server 2016 (Server Core installation)
Microsoft System Center 2012 R2 Endpoint Protection
Windows Defender on Windows Server 2012 R2 (Server Core installation)
Windows Defender on Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 1803 for x64-based Systems
Windows Defender on Windows 10 Version 1903 for x64-based Systems
azure-iot-cli-extension
.NET 5.0
Windows Defender on Windows Server 2016
Windows 8.1 for x64-based systems
Windows Defender on Windows 7 for 32-bit Systems Service Pack 1
Windows Defender on Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows Defender on Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1803 for 32-bit Systems
Microsoft Dynamics 365 (on-premises) version 8.2
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 2004 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Microsoft Azure Kubernetes Service

Visual Studio Code - npm-script Extension
Windows 10 Version 2004 for ARM64-based Systems
Windows Defender on Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Microsoft Security Essentials
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows Server, version 2004 (Server Core installation)
Windows Defender on Windows 10 for 32-bit Systems
Microsoft Endpoint Protection
Windows Defender on Windows 10 Version 1803 for x64-based Systems
Windows Defender on Windows 10 for x64-based Systems
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows 10 Version 1809 for x64-based Systems
Package Manager Configurations
Windows Defender on Windows 10 Version 20H2 for 32-bit Systems
Windows Defender on Windows 10 Version 20H2 for ARM64-based Systems
Windows Server, version 20H2 (Server Core Installation)
Microsoft System Center 2012 Endpoint Protection
System Center 2019 Operations Manager
Windows Defender on Windows Server, version 20H2 (Server Core Installation)
Windows Defender on Windows 8.1 for 32-bit systems
Windows Defender on Windows 10 Version 1903 for ARM64-based Systems
Dynamics 365 Business Central 2019 Release Wave 2 (On-Premise)
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows Defender on Windows 10 Version 1803 for 32-bit Systems
Visual Studio Code
Windows Defender on Windows 10 Version 1903 for 32-bit Systems
Microsoft Teams for iOS
Windows Defender on Windows Server, version 2004 (Server Core installation)
Windows Defender on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft Dynamics NAV 2015
Windows Defender on Windows 10 Version 1607 for 32-bit Systems
Windows Defender on Windows 10 Version 1909 for ARM64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Windows Defender on Windows 10 Version 2004 for x64-based Systems
Windows 8.1 for 32-bit systems
Windows Defender on Windows 10 Version 1607 for x64-based Systems
Windows Defender on Windows 8.1 for x64-based systems
Windows Defender on Windows Server 2019 (Server Core installation)
Windows Server, version 1909 (Server Core installation)
.NET Core 3.1
Windows Defender on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
PsExec
Windows Defender on Windows Server, version 1909 (Server Core installation)
Windows 10 Version 1909 for ARM64-based Systems

Windows Defender on Windows 10 Version 2004 for ARM64-based Systems
Windows Defender on Windows Server, version 1903 (Server Core installation)
.NET Core 2.1
Microsoft Dynamics 365 (on-premises) version 9.0
Microsoft Dynamics NAV 2016
Microsoft Dynamics NAV 2018
Windows Defender on Windows 10 Version 1809 for 32-bit Systems
Microsoft Dynamics NAV 2017
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Windows Defender on Windows 10 Version 1909 for x64-based Systems
Windows Defender on Windows 10 Version 2004 for 32-bit Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Defender on Windows Server 2012 R2
Windows 10 Version 1803 for ARM64-based Systems
Windows Defender on Windows 10 Version 1809 for ARM64-based Systems
Microsoft System Center Endpoint Protection
Microsoft Visual Studio 2019 version 16.8
Windows Defender on Windows Server 2012 (Server Core installation)
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows Defender on Windows 7 for x64-based Systems Service Pack 1
Microsoft Dynamics 365 Business Central 2020 Release Wave 2

MS21-JAN: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their January 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-1644 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-1643 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-1642 - Windows AppX Deployment Extensions Elevation of Privilege Vulnerability
CVE-2021-1637 - Windows DNS Query Information Disclosure Vulnerability
CVE-2021-1647 - Microsoft Defender Remote Code Execution Vulnerability
CVE-2021-1651 - Diagnostics Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2021-1652 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2021-1653 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2021-1654 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2021-1655 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2021-1656 - TPM Device Driver Information Disclosure Vulnerability
CVE-2021-1657 - Windows Fax Compose Form Remote Code Execution Vulnerability
CVE-2021-1658 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-1659 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2021-1660 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-1661 - Windows Installer Elevation of Privilege Vulnerability
CVE-2021-1662 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-1663 - Windows Projected File System FS Filter Driver Information Disclosure Vulnerability
CVE-2021-1664 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-1665 - GDI+ Remote Code Execution Vulnerability
CVE-2021-1666 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-1667 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-1668 - Microsoft DTV-DVD Video Decoder Remote Code Execution Vulnerability
CVE-2021-1669 - Windows Remote Desktop Security Feature Bypass Vulnerability
CVE-2021-1670 - Windows Projected File System FS Filter Driver Information Disclosure Vulnerability
CVE-2021-1671 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-1672 - Windows Projected File System FS Filter Driver Information Disclosure Vulnerability
CVE-2021-1673 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-1674 - Windows Remote Desktop Protocol Core Security Feature Bypass Vulnerability
CVE-2021-1676 - Windows NT Lan Manager Datagram Receiver Driver Information Disclosure Vulnerability
CVE-2021-1679 - Windows CryptoAPI Denial of Service Vulnerability
CVE-2021-1680 - Diagnostics Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2021-1681 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2021-1682 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-1683 - Windows Bluetooth Security Feature Bypass Vulnerability
CVE-2021-1684 - Windows Bluetooth Security Feature Bypass Vulnerability
CVE-2021-1685 - Windows AppX Deployment Extensions Elevation of Privilege Vulnerability
CVE-2021-1686 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2021-1687 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2021-1688 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2021-1689 - Windows Multipoint Management Elevation of Privilege Vulnerability
CVE-2021-1690 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2021-1691 - Hyper-V Denial of Service Vulnerability
CVE-2021-1692 - Hyper-V Denial of Service Vulnerability

CVE-2021-1693 - Windows CSC Service Elevation of Privilege Vulnerability
CVE-2021-1694 - Windows Update Stack Elevation of Privilege Vulnerability
CVE-2021-1695 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2021-1696 - Windows Graphics Component Information Disclosure Vulnerability
CVE-2021-1697 - Windows InstallService Elevation of Privilege Vulnerability
CVE-2021-1708 - Windows GDI+ Information Disclosure Vulnerability
CVE-2021-1709 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2021-1710 - Microsoft Windows Media Foundation Remote Code Execution Vulnerability
CVE-2020-26870 - Visual Studio Remote Code Execution Vulnerability
CVE-2021-1723 - ASP.NET Core and Visual Studio Denial of Service Vulnerability
CVE-2021-1725 - Bot Framework SDK Information Disclosure Vulnerability
CVE-2021-1650 - Windows Runtime C++ Template Library Elevation of Privilege Vulnerability
CVE-2021-1649 - Active Template Library Elevation of Privilege Vulnerability
CVE-2021-1648 - Microsoft splwow64 Elevation of Privilege Vulnerability
CVE-2021-1646 - Windows WLAN Service Elevation of Privilege Vulnerability
CVE-2021-1645 - Windows Docker Information Disclosure Vulnerability
CVE-2021-1638 - Windows Bluetooth Security Feature Bypass Vulnerability
CVE-2021-1677 - Azure Active Directory Pod Identity Spoofing Vulnerability
CVE-2021-1678 - NTLM Security Feature Bypass Vulnerability
CVE-2021-1699 - Windows (modem.sys) Information Disclosure Vulnerability
CVE-2021-1700 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-1701 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2021-1702 - Windows Remote Procedure Call Runtime Elevation of Privilege Vulnerability
CVE-2021-1703 - Windows Event Logging Service Elevation of Privilege Vulnerability
CVE-2021-1704 - Windows Hyper-V Elevation of Privilege Vulnerability
CVE-2021-1706 - Windows LUAFV Elevation of Privilege Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows Defender on Windows Server 2019
Windows Defender on Windows Server 2012
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
HEVC Video Extensions
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Defender on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 (Server Core installation)
Windows Defender on Windows 10 Version 1803 for ARM64-based Systems
Windows Server 2019
Microsoft Visual Studio 2019 version 16.0
Windows Defender on Windows Server 2016 (Server Core installation)
Microsoft System Center 2012 R2 Endpoint Protection
Windows Defender on Windows Server 2012 R2 (Server Core installation)
Windows Defender on Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 1803 for x64-based Systems

Windows Defender on Windows Server 2016
Windows 8.1 for x64-based systems
Bot Framework SDK for .NET Framework
Windows Defender on Windows 7 for 32-bit Systems Service Pack 1
Windows Defender on Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows Defender on Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1803 for 32-bit Systems
Microsoft Remote Desktop for Android
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Remote Desktop client for Windows Desktop
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows Defender on Windows RT 8.1
Microsoft Azure Kubernetes Service
Windows 10 Version 2004 for ARM64-based Systems
Microsoft Visual Studio 2015 Update 3
Windows Defender on Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft Security Essentials
Windows 10 for x64-based Systems
Microsoft Remote Desktop
Windows Server, version 2004 (Server Core installation)
Windows Defender on Windows 10 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows Defender on Windows 10 Version 1803 for x64-based Systems
Windows Defender on Windows 10 for x64-based Systems
Windows 10 Version 1809 for x64-based Systems
Windows Defender on Windows 10 Version 20H2 for 32-bit Systems
Windows Defender on Windows 10 Version 20H2 for ARM64-based Systems
Windows Server, version 20H2 (Server Core Installation)
Microsoft System Center 2012 Endpoint Protection
Windows Defender on Windows Server, version 20H2 (Server Core Installation)
Windows Defender on Windows 8.1 for 32-bit systems
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows Defender on Windows 10 Version 1803 for 32-bit Systems
Windows Defender on Windows Server, version 2004 (Server Core installation)
Windows Defender on Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Defender on Windows 10 Version 1607 for 32-bit Systems
Windows Defender on Windows 10 Version 1909 for ARM64-based Systems
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Bot Framework SDK for JavaScript
Windows Defender on Windows 10 Version 2004 for x64-based Systems

Windows 8.1 for 32-bit systems
ASP.NET Core 3.1
Windows Defender on Windows 10 Version 1607 for x64-based Systems
Windows Defender on Windows 8.1 for x64-based systems
Windows Defender on Windows Server 2019 (Server Core installation)
Windows Server, version 1909 (Server Core installation)
Windows Defender on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Bot Framework SDK for Python
Windows Defender on Windows Server, version 1909 (Server Core installation)
Windows 10 Version 1909 for ARM64-based Systems
Windows Defender on Windows 10 Version 2004 for ARM64-based Systems
Windows 7 for 32-bit Systems Service Pack 1
Windows Defender on Windows 10 Version 1809 for 32-bit Systems
Windows RT 8.1
Windows Defender on Windows 10 Version 1909 for x64-based Systems
Windows Defender on Windows 10 Version 2004 for 32-bit Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Defender on Windows Server 2012 R2
Windows 10 Version 1803 for ARM64-based Systems
Windows Defender on Windows 10 Version 1809 for ARM64-based Systems
Microsoft Visual Studio 2019 version 16.8
Microsoft System Center Endpoint Protection
Windows Defender on Windows Server 2012 (Server Core installation)
ASP.NET Core 5.0
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows Defender on Windows 7 for x64-based Systems Service Pack 1

CVSS Base Score: 9.8

MS21-JUL: Microsoft Windows Out-of-Band Security Update — High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their July 2021 out-of-band Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Workarounds:
Determine if the Print Spooler service is running:

Get-Service -Name Spooler

If the Print Spooler is running or if the service is not set to disabled, select one of the following options to either disable the Print Spooler service, or to Disable inbound remote printing through Group Policy:

Option 1 - Disable the Print Spooler service

If disabling the Print Spooler service is appropriate for your enterprise, use the following PowerShell commands:
Stop-Service -Name Spooler -Force
Set-Service -Name Spooler -StartupType Disabled

Impact of workaround: Disabling the Print Spooler service disables the ability to print both locally and remotely.

Option 2 - Disable inbound remote printing through Group Policy

Configure the settings via Group Policy as follows:
Computer Configuration / Administrative Templates / Printers
Disable the “Allow Print Spooler to accept client connections:” policy to block remote attacks.
You must restart the Print Spooler service for the group policy to take effect.

Impact of workaround This policy will block the remote attack vector by preventing inbound remote printing operations. The system will no longer function as a print server, but local printing to a directly attached device will still be possible.

Vulnerability Details

Remote code execution exploit in the Windows Print Spooler service known as “PrintNightmare”.

Microsoft has released a security update which includes fixes for the following vulnerability:

CVE-2021-34527 - Windows Print Spooler Remote Code Execution Vulnerability

Affected Products:
Windows 7 for x64-based Systems Service Pack 1
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Windows 8.1 for x64-based systems
Windows 8.1 for 32-bit systems
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows Server 2008 for x64-based Systems Service Pack 2
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Windows Server 2019 (Server Core installation)
Windows Server 2019

Windows 10 for x64-based Systems
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 1809 for 32-bit Systems
Windows 10 Version 1909 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows Server, version 2004 (Server Core installation)
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Server, version 20H2 (Server Core Installation)
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 21H1 for 32-bit Systems
Windows 10 Version 21H1 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems

https://support.microsoft.com/en-us/topic/july-6-2021-kb5004951-security-only-update-out-of-band-e05a81cd-9b45-4622-b715-ddb2367bca47
Impact:
An attacker who successfully exploited this vulnerability could run arbitrary code with SYSTEM privileges. An attacker could then install programs; view, change, or delete data; or create new accounts with full user rights.

CVSS Base Score: 9

MS21-JUL: Microsoft Windows Security Update High

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-31183 - Windows TCP/IP Driver Denial of Service Vulnerability
CVE-2021-31947 - HEVC Video Extensions Remote Code Execution Vulnerability

CVE-2021-31961 - Windows InstallService Elevation of Privilege Vulnerability
CVE-2021-31984 - Power BI Remote Code Execution Vulnerability
CVE-2021-33740 - Windows Media Remote Code Execution Vulnerability
CVE-2021-33743 - Windows Projected File System Elevation of Privilege Vulnerability
CVE-2021-33744 - Windows Secure Kernel Mode Security Feature Bypass Vulnerability
CVE-2021-33753 - Microsoft Bing Search Spoofing Vulnerability
CVE-2021-33755 - Windows Hyper-V Denial of Service Vulnerability
CVE-2021-33757 - Windows Security Account Manager Remote Protocol Security Feature Bypass Vulnerability
CVE-2021-33758 - Windows Hyper-V Denial of Service Vulnerability
CVE-2021-33759 - Windows Desktop Bridge Elevation of Privilege Vulnerability
CVE-2021-33760 - Media Foundation Information Disclosure Vulnerability
CVE-2021-33761 - Windows Remote Access Connection Manager Elevation of Privilege Vulnerability
CVE-2021-33763 - Windows Remote Access Connection Manager Information Disclosure Vulnerability
CVE-2021-33765 - Windows Installer Spoofing Vulnerability
CVE-2021-33767 - Open Enclave SDK Elevation of Privilege Vulnerability
CVE-2021-33771 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-33773 - Windows Remote Access Connection Manager Elevation of Privilege Vulnerability
CVE-2021-33774 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-33780 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-34441 - Microsoft Windows Media Foundation Remote Code Execution Vulnerability
CVE-2021-34442 - Windows DNS Server Denial of Service Vulnerability
CVE-2021-34491 - Win32k Information Disclosure Vulnerability
CVE-2021-34492 - Windows Certificate Spoofing Vulnerability
CVE-2021-34493 - Windows Partition Management Driver Elevation of Privilege Vulnerability
CVE-2021-34444 - Windows DNS Server Denial of Service Vulnerability
CVE-2021-34494 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-34445 - Windows Remote Access Connection Manager Elevation of Privilege Vulnerability
CVE-2021-34446 - Windows HTML Platforms Security Feature Bypass Vulnerability
CVE-2021-34496 - Windows GDI Information Disclosure Vulnerability
CVE-2021-34447 - Windows MSHTML Platform Remote Code Execution Vulnerability
CVE-2021-34497 - Windows MSHTML Platform Remote Code Execution Vulnerability
CVE-2021-34448 - Scripting Engine Memory Corruption Vulnerability
CVE-2021-34498 - Windows GDI Elevation of Privilege Vulnerability
CVE-2021-34449 - Win32k Elevation of Privilege Vulnerability
CVE-2021-34499 - Windows DNS Server Denial of Service Vulnerability
CVE-2021-34450 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2021-34500 - Windows Kernel Memory Information Disclosure Vulnerability
CVE-2021-34521 - Raw Image Extension Remote Code Execution Vulnerability
CVE-2021-34474 - Dynamics Business Central Remote Code Execution Vulnerability
CVE-2021-34476 - Bowser.sys Denial of Service Vulnerability
CVE-2021-34528 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-34479 - Microsoft Visual Studio Spoofing Vulnerability
CVE-2021-31979 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-33745 - Windows DNS Server Denial of Service Vulnerability
CVE-2021-33746 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-33749 - Windows DNS Snap-in Remote Code Execution Vulnerability
CVE-2021-33750 - Windows DNS Snap-in Remote Code Execution Vulnerability
CVE-2021-33751 - Storage Spaces Controller Elevation of Privilege Vulnerability

CVE-2021-33752 - Windows DNS Snap-in Remote Code Execution Vulnerability
CVE-2021-33754 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-33756 - Windows DNS Snap-in Remote Code Execution Vulnerability
CVE-2021-33764 - Windows Key Distribution Center Information Disclosure Vulnerability
CVE-2021-33772 - Windows TCP/IP Driver Denial of Service Vulnerability
CVE-2021-33775 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-33776 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-33777 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-33778 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-33779 - Windows ADFS Security Feature Bypass Vulnerability
CVE-2021-33781 - Active Directory Security Feature Bypass Vulnerability
CVE-2021-33782 - Windows Authenticode Spoofing Vulnerability
CVE-2021-33783 - Windows SMB Information Disclosure Vulnerability
CVE-2021-33784 - Windows Cloud Files Mini Filter Driver Elevation of Privilege Vulnerability
CVE-2021-33785 - Windows AF_UNIX Socket Provider Denial of Service Vulnerability
CVE-2021-33786 - Windows LSA Security Feature Bypass Vulnerability
CVE-2021-33788 - Windows LSA Denial of Service Vulnerability
CVE-2021-34438 - Windows Font Driver Host Remote Code Execution Vulnerability
CVE-2021-34439 - Microsoft Windows Media Foundation Remote Code Execution Vulnerability
CVE-2021-34488 - Windows Console Driver Elevation of Privilege Vulnerability
CVE-2021-34489 - DirectWrite Remote Code Execution Vulnerability
CVE-2021-34440 - GDI+ Information Disclosure Vulnerability
CVE-2021-34490 - Windows TCP/IP Driver Denial of Service Vulnerability
CVE-2021-34503 - Microsoft Windows Media Foundation Remote Code Execution Vulnerability
CVE-2021-34454 - Windows Remote Access Connection Manager Information Disclosure Vulnerability
CVE-2021-34504 - Windows Address Book Remote Code Execution Vulnerability
CVE-2021-34455 - Windows File History Service Elevation of Privilege Vulnerability
CVE-2021-34456 - Windows Remote Access Connection Manager Elevation of Privilege Vulnerability
CVE-2021-34457 - Windows Remote Access Connection Manager Information Disclosure Vulnerability
CVE-2021-34507 - Windows Remote Assistance Information Disclosure Vulnerability
CVE-2021-34458 - Windows Kernel Remote Code Execution Vulnerability
CVE-2021-34508 - Windows Kernel Remote Code Execution Vulnerability
CVE-2021-34459 - Windows AppContainer Elevation Of Privilege Vulnerability
CVE-2021-34509 - Storage Spaces Controller Information Disclosure Vulnerability
CVE-2021-34460 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-34510 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-34511 - Windows Installer Elevation of Privilege Vulnerability
CVE-2021-34461 - Windows Container Isolation FS Filter Driver Elevation of Privilege Vulnerability
CVE-2021-34512 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-34462 - Windows AppX Deployment Extensions Elevation of Privilege Vulnerability
CVE-2021-34513 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-34514 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-34464 - Microsoft Defender Remote Code Execution Vulnerability
CVE-2021-34516 - Win32k Elevation of Privilege Vulnerability
CVE-2021-34466 - Windows Hello Security Feature Bypass Vulnerability
CVE-2021-34522 - Microsoft Defender Remote Code Execution Vulnerability
CVE-2021-34525 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-34527 - Windows Print Spooler Remote Code Execution Vulnerability
CVE-2021-34477 - Visual Studio Code .NET Runtime Elevation of Privilege Vulnerability

CVE-2021-34529 - Visual Studio Code Remote Code Execution Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
HEVC Video Extensions
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Windows Server 2012 (Server Core installation)
Windows Server 2019
.NET Install Tool for Extension Authors
Windows 8.1 for x64-based systems
Microsoft Dynamics 365 Business Central 2021 Release Wave 1 - Update 18.3
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Microsoft Dynamics 365 Business Central 2020 Release Wave 1 - Update 16.14
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows Server, version 2004 (Server Core installation)
Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 21H1 for ARM64-based Systems
Windows Server, version 20H2 (Server Core Installation)
Microsoft Malware Protection Engine
Windows Server 2012
Open Enclave SDK
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Microsoft Dynamics 365 Business Central 2020 Release Wave 2 - Update 17.8

MS21-JUN: Microsoft Windows Security Update High

Solution Details

Microsoft has released a fix for this flaw in their June 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-1675 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2021-26414 - Windows DCOM Server Security Feature Bypass
CVE-2021-31938 - Microsoft VsCode Kubernetes Tools Extension Elevation of Privilege Vulnerability
CVE-2021-31942 - 3D Viewer Remote Code Execution Vulnerability
CVE-2021-31943 - 3D Viewer Remote Code Execution Vulnerability
CVE-2021-31944 - 3D Viewer Information Disclosure Vulnerability
CVE-2021-31945 - Paint 3D Remote Code Execution Vulnerability
CVE-2021-31946 - Paint 3D Remote Code Execution Vulnerability
CVE-2021-31951 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-31952 - Windows Kernel-Mode Driver Elevation of Privilege Vulnerability
CVE-2021-31953 - Windows Filter Manager Elevation of Privilege Vulnerability
CVE-2021-31954 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2021-31955 - Windows Kernel Information Disclosure Vulnerability
CVE-2021-31956 - Windows NTFS Elevation of Privilege Vulnerability
CVE-2021-31957 - .NET Core and Visual Studio Denial of Service Vulnerability
CVE-2021-31958 - Windows NTLM Elevation of Privilege Vulnerability
CVE-2021-31959 - Scripting Engine Memory Corruption Vulnerability
CVE-2021-31960 - Windows Bind Filter Driver Information Disclosure Vulnerability
CVE-2021-31962 - Kerberos AppContainer Security Feature Bypass Vulnerability
CVE-2021-31967 - VP9 Video Extensions Remote Code Execution Vulnerability
CVE-2021-31980 - Microsoft Intune Management Extension Remote Code Execution Vulnerability
CVE-2021-31983 - Paint 3D Remote Code Execution Vulnerability
CVE-2021-33739 - Microsoft DWM Core Library Elevation of Privilege Vulnerability
CVE-2021-33742 - Windows MSHTML Platform Remote Code Execution Vulnerability
CVE-2021-31199 - Microsoft Enhanced Cryptographic Provider Elevation of Privilege Vulnerability
CVE-2021-31201 - Microsoft Enhanced Cryptographic Provider Elevation of Privilege Vulnerability
CVE-2021-31968 - Windows Remote Desktop ServicesÂ Denial of Service Vulnerability

CVE-2021-31969 - Windows Cloud Files Mini Filter Driver Elevation of Privilege Vulnerability
CVE-2021-31970 - Windows TCP/IP Driver Security Feature Bypass Vulnerability
CVE-2021-31971 - Windows HTML Platform Security Feature Bypass Vulnerability
CVE-2021-31972 - Event Tracing for Windows Information Disclosure Vulnerability
CVE-2021-31973 - Windows GPSVC Elevation of Privilege Vulnerability
CVE-2021-31974 - Server for NFS Denial of Service Vulnerability
CVE-2021-31975 - Server for NFS Information Disclosure Vulnerability
CVE-2021-31976 - Server for NFS Information Disclosure Vulnerability
CVE-2021-31977 - Windows Hyper-V Denial of Service Vulnerability
CVE-2021-31978 - Microsoft Defender Denial of Service Vulnerability
CVE-2021-31985 - Microsoft Defender Remote Code Execution Vulnerability
CVE-2021-33741 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Paint 3D
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows Server, version 20H2 (Server Core Installation)
Intune management extension
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Microsoft Malware Protection Engine
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Microsoft Edge (Chromium-based)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Windows Server 2012 (Server Core installation)
Windows Server 2019
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
.NET 5.0
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Microsoft Visual Studio 2019 version 16.10 (includes 16.0 - 16.9)
Visual Studio 2019 for Mac version 8.10
Windows 10 Version 20H2 for ARM64-based Systems
.NET Core 3.1
Windows 10 Version 1909 for x64-based Systems
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Windows 10 Version 1909 for ARM64-based Systems
Visual Studio Code - Kubernetes Tools
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)

Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
VP9 Video Extensions
Windows Server, version 2004 (Server Core installation)
Windows Server 2019 (Server Core installation)
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows Server 2016
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
3D Viewer
Windows 10 Version 21H1 for ARM64-based Systems

CVSS Base Score: 9.8

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H

MS21-MAR: Microsoft Internet Explorer Security Update High

Solution Details

Microsoft has released a fix for this flaw in their March 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2021-26411 - Internet Explorer Memory Corruption Vulnerability
CVE-2021-27085 - Internet Explorer Remote Code Execution Vulnerability

Affected Products:
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 20H2 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1903 for ARM64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for 32-bit Systems
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 20H2 for x64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for ARM64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 20H2 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1903 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows Server 2016

Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 2004 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 20H2 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1809 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows RT 8.1
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1803 for ARM64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 20H2 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows Server 2019
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2012
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 2004 for 32-bit Systems
Microsoft Edge (EdgeHTML-based) on Windows 10 Version 1607 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 20H2 for 32-bit Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS21-MAR: Microsoft Windows Security Update High

Solution Details

Microsoft has released a fix for this flaw in their March 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-1640 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2021-1729 - Windows Update Stack Setup Elevation of Privilege Vulnerability
CVE-2021-24095 - DirectX Elevation of Privilege Vulnerability
CVE-2021-27060 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-27070 - Windows 10 Update Assistant Elevation of Privilege Vulnerability
CVE-2021-27074 - Azure Sphere Unsigned Code Execution Vulnerability
CVE-2021-27075 - Azure Virtual Machine Information Disclosure Vulnerability

CVE-2021-27077 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2021-27080 - Azure Sphere Unsigned Code Execution Vulnerability
CVE-2021-27081 - Visual Studio Code ESLint Extension Remote Code Execution Vulnerability
CVE-2021-27082 - Quantum Development Kit for Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-27083 - Remote Development Extension for Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-24089 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-24090 - Windows Error Reporting Elevation of Privilege Vulnerability
CVE-2021-24107 - Windows Event Tracing Information Disclosure Vulnerability
CVE-2021-24110 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-26859 - Microsoft Power BI Information Disclosure Vulnerability
CVE-2021-26860 - Windows App-V Overlay Filter Elevation of Privilege Vulnerability
CVE-2021-26861 - Windows Graphics Component Remote Code Execution Vulnerability
CVE-2021-26862 - Windows Installer Elevation of Privilege Vulnerability
CVE-2021-26863 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2021-26864 - Windows Virtual Registry Provider Elevation of Privilege Vulnerability
CVE-2021-26865 - Windows Container Execution Agent Elevation of Privilege Vulnerability
CVE-2021-26866 - Windows Update Service Elevation of Privilege Vulnerability
CVE-2021-26867 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2021-26868 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2021-26869 - Windows ActiveX Installer Service Information Disclosure Vulnerability
CVE-2021-26870 - Windows Projected File System Elevation of Privilege Vulnerability
CVE-2021-26871 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2021-26872 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-26873 - Windows User Profile Service Elevation of Privilege Vulnerability
CVE-2021-26874 - Windows Overlay Filter Elevation of Privilege Vulnerability
CVE-2021-26875 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2021-26876 - OpenType Font Parsing Remote Code Execution Vulnerability
CVE-2021-26877 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-26878 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2021-26879 - Windows NAT Denial of Service Vulnerability
CVE-2021-26880 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-26881 - Microsoft Windows Media Foundation Remote Code Execution Vulnerability
CVE-2021-26882 - Remote Access API Elevation of Privilege Vulnerability
CVE-2021-26884 - Windows Media Photo Codec Information Disclosure Vulnerability
CVE-2021-26885 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2021-26886 - User Profile Service Denial of Service Vulnerability
CVE-2021-26887 - Microsoft Windows Folder Redirection Elevation of Privilege Vulnerability
CVE-2021-26889 - Windows Update Stack Elevation of Privilege Vulnerability
CVE-2021-26890 - Application Virtualization Remote Code Execution Vulnerability
CVE-2021-26891 - Windows Container Execution Agent Elevation of Privilege Vulnerability
CVE-2021-26892 - Windows Extensible Firmware Interface Security Feature Bypass Vulnerability
CVE-2021-26893 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-26894 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-26895 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-26896 - Windows DNS Server Denial of Service Vulnerability
CVE-2021-26897 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-26898 - Windows Event Tracing Elevation of Privilege Vulnerability

CVE-2021-26899 - Windows UPnP Device Host Elevation of Privilege Vulnerability
CVE-2021-26900 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2021-26901 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-26902 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-27047 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-27048 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-27049 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-27050 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-27051 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-27058 - Microsoft Office ClickToRun Remote Code Execution Vulnerability
CVE-2021-27061 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-27062 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-27063 - Windows DNS Server Denial of Service Vulnerability
CVE-2021-27066 - Windows Admin Center Security Feature Bypass Vulnerability
CVE-2021-21300 - Git for Visual Studio Remote Code Execution Vulnerability
CVE-2021-27084 - Visual Studio Code Java Extension Pack Remote Code Execution Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
HEVC Video Extensions
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Microsoft Quantum Development Kit for Visual Studio Code
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Microsoft 365 Apps for Enterprise for 64-bit Systems
Windows Server 2019
Windows 10 Version 1803 for x64-based Systems
Windows 8.1 for x64-based systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Power BI Report Server version 15.0.1103.234
Microsoft Visual Studio 2019 version 16.8 (includes 16.0 - 16.7)
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Visual Studio Code Remote - Containers Extension
Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows Server, version 2004 (Server Core installation)

Azure Container Instance
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Azure Sphere
Azure Spring Cloud
Windows 10 Version 1809 for x64-based Systems
Windows Server, version 20H2 (Server Core Installation)
Windows Admin Center
Microsoft 365 Apps for Enterprise for 32-bit Systems
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Azure Kubernetes Service
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Azure Service Fabric
Windows Server, version 1909 (Server Core installation)
Power BI Report Server version 15.0.1104.300
Visual Studio Code - Java Extension Pack
Microsoft Visual Studio Code ESLint extension
Windows 10 Version 1909 for ARM64-based Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows 10 Version 1803 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

MS21-MAY: Microsoft Internet Explorer Security Update High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their May 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2021-26419 - Scripting Engine Memory Corruption Vulnerability

Affected Products:
Internet Explorer 11 on Windows 10 Version 2004 for ARM64-based Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 20H2 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 2004 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1909 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 20H2 for ARM64-based Systems
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2012
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 2004 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 20H2 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1909 for 32-bit Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems

CVSS Base Score: 7.5

MS21-MAY: Microsoft Windows Security Update — High

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2020-24588 - Windows Wireless Networking Spoofing Vulnerability
CVE-2020-24587 - Windows Wireless Networking Information Disclosure Vulnerability
CVE-2021-27068 - Visual Studio Remote Code Execution Vulnerability
CVE-2020-26144 - Windows Wireless Networking Spoofing Vulnerability
CVE-2021-28461 - Dynamics Finance and Operations Cross-site Scripting Vulnerability
CVE-2021-28479 - Windows CSC Service Information Disclosure Vulnerability
CVE-2021-31165 - Windows Container Manager Service Elevation of Privilege Vulnerability
CVE-2021-31166 - HTTP Protocol Stack Remote Code Execution Vulnerability
CVE-2021-31167 - Windows Container Manager Service Elevation of Privilege Vulnerability
CVE-2021-31168 - Windows Container Manager Service Elevation of Privilege Vulnerability
CVE-2021-31169 - Windows Container Manager Service Elevation of Privilege Vulnerability
CVE-2021-31170 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2021-31182 - Microsoft Bluetooth Driver Spoofing Vulnerability
CVE-2021-31184 - Microsoft Windows Infrared Data Association (IrDA) Information Disclosure Vulnerability
CVE-2021-31185 - Windows Desktop Bridge Denial of Service Vulnerability
CVE-2021-31186 - Windows Remote Desktop Protocol (RDP) Information Disclosure Vulnerability
CVE-2021-31187 - Windows WalletService Elevation of Privilege Vulnerability
CVE-2021-31188 - Windows Graphics Component Elevation of Privilege Vulnerability

CVE-2021-31190 - Windows Container Isolation FS Filter Driver Elevation of Privilege Vulnerability
CVE-2021-31191 - Windows Projected File System FS Filter Driver Information Disclosure Vulnerability
CVE-2021-31192 - Windows Media Foundation Core Remote Code Execution Vulnerability
CVE-2021-31193 - Windows SSDP Service Elevation of Privilege Vulnerability
CVE-2021-31194 - OLE Automation Remote Code Execution Vulnerability
CVE-2021-31204 - .NET and Visual Studio Elevation of Privilege Vulnerability
CVE-2021-31205 - Windows SMB Client Security Feature Bypass Vulnerability
CVE-2021-31208 - Windows Container Manager Service Elevation of Privilege Vulnerability
CVE-2021-31211 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-31213 - Visual Studio Code Remote Containers Extension Remote Code Execution Vulnerability
CVE-2021-31214 - Visual Studio Code Remote Code Execution Vulnerability
CVE-2021-28465 - Web Media Extensions Remote Code Execution Vulnerability
CVE-2021-28476 - Hyper-V Remote Code Execution Vulnerability
CVE-2021-31200 - Common Utilities Remote Code Execution Vulnerability
CVE-2021-31936 - Microsoft Accessibility Insights for Web Information Disclosure Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows Server, version 20H2 (Server Core Installation)
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Dynamics 365 for Finance and Operations
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2019
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Windows 10 Version 1803 for x64-based Systems
common_utils.py
.NET 5.0
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows Server, version 1909 (Server Core installation)
.NET Core 3.1
Windows 10 Version 1909 for x64-based Systems
Microsoft Accessibility Insights for Web
Visual Studio 2019 for Mac version 8.9
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Visual Studio Code Remote - Containers Extension
Windows 10 Version 1909 for ARM64-based Systems

Windows 10 Version 1803 for 32-bit Systems
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Web Media Extensions
Windows 10 Version 2004 for 32-bit Systems
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 Version 1803 for ARM64-based Systems
Windows Server, version 2004 (Server Core installation)
Windows Server 2019 (Server Core installation)
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows Server 2016
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their May 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

MS21-NOV: Microsoft Windows Security Update — High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their November 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-36957 - Windows Desktop Bridge Elevation of Privilege Vulnerability
CVE-2021-38631 - Windows Remote Desktop Protocol (RDP) Information Disclosure Vulnerability
CVE-2021-3711 - OpenSSL: CVE-2021-3711 SM2 Decryption Buffer Overflow
CVE-2021-41366 - Credential Security Support Provider Protocol (CredSSP) Elevation of Privilege Vulnerability
CVE-2021-41367 - NTFS Elevation of Privilege Vulnerability
CVE-2021-41371 - Windows Remote Desktop Protocol (RDP) Information Disclosure Vulnerability
CVE-2021-41372 - Power BI Report Server Spoofing Vulnerability
CVE-2021-41377 - Windows Fast FAT File System Driver Elevation of Privilege Vulnerability
CVE-2021-41378 - Windows NTFS Remote Code Execution Vulnerability
CVE-2021-41379 - Windows Installer Elevation of Privilege Vulnerability
CVE-2021-26443 - Microsoft Virtual Machine Bus (VMBus) Remote Code Execution Vulnerability
CVE-2021-42274 - Windows Hyper-V Discrete Device Assignment (DDA) Denial of Service Vulnerability
CVE-2021-42275 - Microsoft COM for Windows Remote Code Execution Vulnerability
CVE-2021-42276 - Microsoft Windows Media Foundation Remote Code Execution Vulnerability
CVE-2021-42278 - Active Directory Domain Services Elevation of Privilege Vulnerability
CVE-2021-42279 - Chakra Scripting Engine Memory Corruption Vulnerability
CVE-2021-42280 - Windows Feedback Hub Elevation of Privilege Vulnerability
CVE-2021-42300 - Azure Sphere Tampering Vulnerability
CVE-2021-42301 - Azure RTOS Information Disclosure Vulnerability
CVE-2021-42302 - Azure RTOS Elevation of Privilege Vulnerability
CVE-2021-42303 - Azure RTOS Elevation of Privilege Vulnerability
CVE-2021-42304 - Azure RTOS Elevation of Privilege Vulnerability
CVE-2021-42316 - Microsoft Dynamics 365 (on-premises) Remote Code Execution Vulnerability
CVE-2021-42319 - Visual Studio Elevation of Privilege Vulnerability
CVE-2021-42322 - Visual Studio Code Elevation of Privilege Vulnerability
CVE-2021-43208 - 3D Viewer Remote Code Execution Vulnerability
CVE-2021-43209 - 3D Viewer Remote Code Execution Vulnerability
CVE-2021-38665 - Remote Desktop Protocol Client Information Disclosure Vulnerability
CVE-2021-38666 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2021-41351 - Microsoft Edge (Chrome based) Spoofing on IE Mode
CVE-2021-41356 - Windows Denial of Service Vulnerability
CVE-2021-41370 - NTFS Elevation of Privilege Vulnerability
CVE-2021-41373 - FSLogix Information Disclosure Vulnerability
CVE-2021-41374 - Azure Sphere Information Disclosure Vulnerability
CVE-2021-41375 - Azure Sphere Information Disclosure Vulnerability
CVE-2021-41376 - Azure Sphere Information Disclosure Vulnerability
CVE-2021-42277 - Diagnostics Hub Standard Collector Elevation of Privilege Vulnerability
CVE-2021-42282 - Active Directory Domain Services Elevation of Privilege Vulnerability
CVE-2021-42283 - NTFS Elevation of Privilege Vulnerability
CVE-2021-42284 - Windows Hyper-V Denial of Service Vulnerability
CVE-2021-42285 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-42286 - Windows Core Shell SI Host Extension Framework for Composable Shell Elevation of Privilege Vulnerability
CVE-2021-42287 - Active Directory Domain Services Elevation of Privilege Vulnerability

CVE-2021-42288 - Windows Hello Security Feature Bypass Vulnerability
CVE-2021-42291 - Active Directory Domain Services Elevation of Privilege Vulnerability
CVE-2021-42298 - Microsoft Defender Remote Code Execution Vulnerability
CVE-2021-42323 - Azure RTOS Information Disclosure Vulnerability
CVE-2021-26444 - Azure RTOS Information Disclosure Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Windows Server 2012 (Server Core installation)
Windows Server 2022 (Server Core installation)
Windows Server 2019
Microsoft Edge (Chromium-based) in IE Mode on Windows 11 for x64-based Systems
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 1909 for 32-bit Systems
Windows 8.1 for x64-based systems
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 11 for x64-based Systems
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Azure RTOS
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Remote Desktop client for Windows Desktop
Microsoft Dynamics 365 (on-premises) version 9.1
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 2004 for ARM64-based Systems
Microsoft Visual Studio 2015 Update 3
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft Edge (Chromium-based) in IE Mode on Windows Server 2019
Windows Server, version 2004 (Server Core installation)
Azure Sphere
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows 10 Version 1809 for x64-based Systems
3D Viewer
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 1909 for ARM64-based Systems
Windows 10 Version 21H1 for ARM64-based Systems
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 1809 for x64-based Systems
Windows Server, version 20H2 (Server Core Installation)

Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 21H1 for x64-based Systems
Microsoft Malware Protection Engine
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 20H2 for ARM64-based Systems
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 1809 for 32-bit Systems
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 2004 for ARM64-based Systems
Windows Server 2022
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Microsoft Edge (Chromium-based) in IE Mode on Windows 11 for ARM64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 21H1 for ARM64-based Systems
Windows Server 2012 R2 (Server Core installation)
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 1809 for ARM64-based Systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 2004 for 32-bit Systems
Power BI Report Server
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 21H1 for 32-bit Systems
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 20H2 for x64-based Systems
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 2004 for x64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
Windows 11 for ARM64-based Systems
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Microsoft Visual Studio 2019 version 16.11 (includes 16.0 - 16.10)
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 2004 for 32-bit Systems
Microsoft Edge (Chromium-based) in IE Mode on Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
FSLogix

MS21-OCT: Microsoft Internet Explorer Security Update — High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their October 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2021-41342 - Windows MSHTML Platform Remote Code Execution Vulnerability

Affected Products:
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Windows Server 2022
Windows Server 2019
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 11 for x64-based Systems
Windows 10 Version 1909 for ARM64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1809 for 32-bit Systems
Windows 11 for ARM64-based Systems
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
Windows Server 2016
Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 21H1 for ARM64-based Systems

MS21-OCT: Microsoft Windows Security Update High

Solution Details

Microsoft has released a fix for this flaw in their October 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-36953 - Windows TCP/IP Denial of Service Vulnerability
CVE-2021-36970 - Windows Print Spooler Spoofing Vulnerability
CVE-2021-40443 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2021-40449 - Win32k Elevation of Privilege Vulnerability
CVE-2021-40455 - Windows Installer Spoofing Vulnerability
CVE-2021-40456 - Windows AD FS Security Feature Bypass Vulnerability
CVE-2021-40457 - Microsoft Dynamics 365 Customer Engagement Cross-Site Scripting Vulnerability
CVE-2021-40475 - Windows Cloud Files Mini Filter Driver Information Disclosure Vulnerability
CVE-2021-40476 - Windows AppContainer Elevation Of Privilege Vulnerability
CVE-2021-40477 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-40478 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-41355 - .NET Core and Visual Studio Information Disclosure Vulnerability
CVE-2021-41361 - Active Directory Federation Server Spoofing Vulnerability
CVE-2021-3450 - OpenSSL: CVE-2021-3450 CA certificate check bypass with X509_V_FLAG_X509_STRICT

CVE-2021-3449 - OpenSSL: CVE-2021-3449 NULL pointer deref in signature_algorithms processing
CVE-2020-1971 - OpenSSL: CVE-2020-1971 EDIPARTYNAME NULL pointer de-reference
CVE-2021-38662 - Windows Fast FAT File System Driver Information Disclosure Vulnerability
CVE-2021-38663 - Windows exFAT File System Information Disclosure Vulnerability
CVE-2021-38672 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2021-40450 - Win32k Elevation of Privilege Vulnerability
CVE-2021-40460 - Windows Remote Procedure Call Runtime Security Feature Bypass Vulnerability
CVE-2021-40461 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2021-40462 - Windows Media Foundation Dolby Digital Atmos Decoders Remote Code Execution Vulnerability
CVE-2021-40463 - Windows NAT Denial of Service Vulnerability
CVE-2021-40464 - Windows Nearby Sharing Elevation of Privilege Vulnerability
CVE-2021-40465 - Windows Text Shaping Remote Code Execution Vulnerability
CVE-2021-40466 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2021-40467 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2021-40468 - Windows Bind Filter Driver Information Disclosure Vulnerability
CVE-2021-40469 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2021-40470 - DirectX Graphics Kernel Elevation of Privilege Vulnerability
CVE-2021-40488 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-40489 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-26441 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-26442 - Windows HTTP.sys Elevation of Privilege Vulnerability
CVE-2021-41330 - Microsoft Windows Media Foundation Remote Code Execution Vulnerability
CVE-2021-41331 - Windows Media Audio Decoder Remote Code Execution Vulnerability
CVE-2021-41332 - Windows Print Spooler Information Disclosure Vulnerability
CVE-2021-41334 - Windows Desktop Bridge Elevation of Privilege Vulnerability
CVE-2021-41335 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-41336 - Windows Kernel Information Disclosure Vulnerability
CVE-2021-41337 - Active Directory Security Feature Bypass Vulnerability
CVE-2021-41338 - Windows AppContainer Firewall Rules Security Feature Bypass Vulnerability
CVE-2021-41339 - Microsoft DWM Core Library Elevation of Privilege Vulnerability
CVE-2021-41340 - Windows Graphics Component Remote Code Execution Vulnerability
CVE-2021-41343 - Windows Fast FAT File System Driver Information Disclosure Vulnerability
CVE-2021-41345 - Storage Spaces Controller Elevation of Privilege Vulnerability
CVE-2021-41346 - Console Window Host Security Feature Bypass Vulnerability
CVE-2021-41347 - Windows AppX Deployment Service Elevation of Privilege Vulnerability
CVE-2021-41352 - SCOM Information Disclosure Vulnerability
CVE-2021-41353 - Microsoft Dynamics 365 (on-premises) Spoofing Vulnerability
CVE-2021-41354 - Microsoft Dynamics 365 (on-premises) Cross-site Scripting Vulnerability
CVE-2021-41357 - Win32k Elevation of Privilege Vulnerability
CVE-2021-37974 - Chromium: CVE-2021-37974 Use after free in Safe Browsing
CVE-2021-37975 - Chromium: CVE-2021-37975 Use after free in V8
CVE-2021-37976 - Chromium: CVE-2021-37976 Information leak in core
CVE-2021-41363 - Intune Management Extension Security Feature Bypass Vulnerability
CVE-2021-37977 - Chromium: CVE-2021-37977 Use after free in Garbage Collection
CVE-2021-37978 - Chromium: CVE-2021-37978 Heap buffer overflow in Blink
CVE-2021-37979 - Chromium: CVE-2021-37979 Heap buffer overflow in WebRTC
CVE-2021-37980 - Chromium: CVE-2021-37980 Inappropriate implementation in Sandbox

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
Windows Server, version 20H2 (Server Core Installation)
Intune management extension
System Center 2019 Operations Manager
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Microsoft Edge (Chromium-based)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Windows Server 2012 (Server Core installation)
Windows Server 2022
Windows Server 2022 (Server Core installation)
Windows Server 2019
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
System Center 2012 R2 Operations Manager
.NET 5.0
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows 8.1 for x64-based systems
Windows Server 2012 R2
System Center 2016 Operations Manager
Windows 8.1 for 32-bit systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 11 for x64-based Systems
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
Windows 10 Version 2004 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows 11 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.1
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Microsoft Visual Studio 2019 version 16.11 (includes 16.0 - 16.10)
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems

Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft Dynamics 365 Customer Engagement V9.1
Windows Server, version 2004 (Server Core installation)
Windows Server 2019 (Server Core installation)
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows Server 2016
Microsoft Dynamics 365 Customer Engagement V9.0
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows 10 Version 21H1 for ARM64-based Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS21-SEP: Microsoft Internet Explorer Security Update High

Solution Details

Microsoft has released a fix for this flaw in their September 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2021-40444 - Microsoft MSHTML Remote Code Execution Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Windows Server, version 20H2 (Server Core Installation)
Windows 10 for 32-bit Systems

Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Windows Server 2012 (Server Core installation)
Windows Server 2022
Windows Server 2022 (Server Core installation)
Windows Server 2019
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 1909 for ARM64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 2004 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 7 for 32-bit Systems Service Pack 1
Windows RT 8.1
Windows 10 Version 2004 for ARM64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 for x64-based Systems
Windows Server, version 2004 (Server Core installation)
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows 10 Version 21H1 for ARM64-based Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS21-SEP: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their September 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2021-36952 - Visual Studio Remote Code Execution Vulnerability
CVE-2021-36954 - Windows Bind Filter Driver Elevation of Privilege Vulnerability
CVE-2021-36955 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2021-36959 - Windows Authenticode Spoofing Vulnerability
CVE-2021-36960 - Windows SMB Information Disclosure Vulnerability
CVE-2021-36961 - Windows Installer Denial of Service Vulnerability
CVE-2021-36962 - Windows Installer Information Disclosure Vulnerability
CVE-2021-36963 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2021-36964 - Windows Event Tracing Elevation of Privilege Vulnerability

CVE-2021-36965 - Windows WLAN AutoConfig Service Remote Code Execution Vulnerability
CVE-2021-36966 - Windows Subsystem for Linux Elevation of Privilege Vulnerability
CVE-2021-36967 - Windows WLAN AutoConfig Service Elevation of Privilege Vulnerability
CVE-2021-36968 - Windows DNS Elevation of Privilege Vulnerability
CVE-2021-36969 - Windows Redirected Drive Buffering SubSystem Driver Information Disclosure Vulnerability
CVE-2021-36972 - Windows SMB Information Disclosure Vulnerability
CVE-2021-36973 - Windows Redirected Drive Buffering System Elevation of Privilege Vulnerability
CVE-2021-36974 - Windows SMB Elevation of Privilege Vulnerability
CVE-2021-36975 - Win32k Elevation of Privilege Vulnerability
CVE-2021-26435 - Windows Scripting Engine Memory Corruption Vulnerability
CVE-2021-26436 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2021-38624 - Windows Key Storage Provider Security Feature Bypass Vulnerability
CVE-2021-38625 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-38626 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2021-38628 - Windows Ancillary Function Driver for WinSock Elevation of Privilege Vulnerability
CVE-2021-38629 - Windows Ancillary Function Driver for WinSock Information Disclosure Vulnerability
CVE-2021-38630 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2021-38632 - BitLocker Security Feature Bypass Vulnerability
CVE-2021-38633 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2021-38634 - Microsoft Windows Update Client Elevation of Privilege Vulnerability
CVE-2021-38635 - Windows Redirected Drive Buffering SubSystem Driver Information Disclosure Vulnerability
CVE-2021-38636 - Windows Redirected Drive Buffering SubSystem Driver Information Disclosure Vulnerability
CVE-2021-38637 - Windows Storage Information Disclosure Vulnerability
CVE-2021-38638 - Windows Ancillary Function Driver for WinSock Elevation of Privilege Vulnerability
CVE-2021-38641 - Microsoft Edge for Android Spoofing Vulnerability
CVE-2021-38642 - Microsoft Edge for iOS Spoofing Vulnerability
CVE-2021-38645 - Open Management Infrastructure Elevation of Privilege Vulnerability
CVE-2021-38647 - Open Management Infrastructure Remote Code Execution Vulnerability
CVE-2021-38648 - Open Management Infrastructure Elevation of Privilege Vulnerability
CVE-2021-38649 - Open Management Infrastructure Elevation of Privilege Vulnerability
CVE-2021-38669 - Microsoft Edge (Chromium-based) Tampering Vulnerability
CVE-2021-26437 - Visual Studio Code Spoofing Vulnerability
CVE-2021-26439 - Microsoft Edge for Android Information Disclosure Vulnerability
CVE-2021-40440 - Microsoft Dynamics Business Central Cross-site Scripting Vulnerability
CVE-2021-36930 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2021-36956 - Azure Sphere Information Disclosure Vulnerability
CVE-2021-26434 - Visual Studio Elevation of Privilege Vulnerability
CVE-2021-38639 - Win32k Elevation of Privilege Vulnerability
CVE-2021-38644 - Microsoft MPEG-2 Video Extension Remote Code Execution Vulnerability
CVE-2021-38656 - Microsoft Word Remote Code Execution Vulnerability
CVE-2021-38657 - Microsoft Office Graphics Component Information Disclosure Vulnerability
CVE-2021-38659 - Microsoft Office Remote Code Execution Vulnerability
CVE-2021-38661 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2021-38667 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2021-38671 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2021-30606 - Chromium: CVE-2021-30606 Use after free in Blink

CVE-2021-30607 - Chromium: CVE-2021-30607 Use after free in Permissions
CVE-2021-30608 - Chromium: CVE-2021-30608 Use after free in Web Share
CVE-2021-30609 - Chromium: CVE-2021-30609 Use after free in Sign-In
CVE-2021-30610 - Chromium: CVE-2021-30610 Use after free in Extensions API
CVE-2021-30611 - Chromium: CVE-2021-30611 Use after free in WebRTC
CVE-2021-30612 - Chromium: CVE-2021-30612 Use after free in WebRTC
CVE-2021-30613 - Chromium: CVE-2021-30613 Use after free in Base internals
CVE-2021-30614 - Chromium: CVE-2021-30614 Heap buffer overflow in TabStrip
CVE-2021-30615 - Chromium: CVE-2021-30615 Cross-origin data leak in Navigation
CVE-2021-30616 - Chromium: CVE-2021-30616 Use after free in Media
CVE-2021-30617 - Chromium: CVE-2021-30617 Policy bypass in Blink
CVE-2021-30618 - Chromium: CVE-2021-30618 Inappropriate implementation in DevTools
CVE-2021-30619 - Chromium: CVE-2021-30619 UI Spoofing in Autofill
CVE-2021-30620 - Chromium: CVE-2021-30620 Insufficient policy enforcement in Blink
CVE-2021-30621 - Chromium: CVE-2021-30621 UI Spoofing in Autofill
CVE-2021-30622 - Chromium: CVE-2021-30622 Use after free in WebApp Installs
CVE-2021-30623 - Chromium: CVE-2021-30623 Use after free in Bookmarks
CVE-2021-30624 - Chromium: CVE-2021-30624 Use after free in Autofill
CVE-2021-40447 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2021-40448 - Microsoft Accessibility Insights for Android Information Disclosure Vulnerability
CVE-2021-30632 - Chromium: CVE-2021-30632 Out of bounds write in V8

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Microsoft Visual Studio 2019 version 16.4 (includes 16.0 - 16.3)
HEVC Video Extensions
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Azure Open Management Infrastructure
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Windows Server 2012 (Server Core installation)
Microsoft 365 Apps for Enterprise for 64-bit Systems
Windows Server 2022 (Server Core installation)
Windows Server 2019
Windows 8.1 for x64-based systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Microsoft Edge for Android
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 2004 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)

Windows 10 Version 2004 for ARM64-based Systems
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows Server, version 2004 (Server Core installation)
Azure Sphere
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 â€“ 16.6)
Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 21H1 for ARM64-based Systems
Windows Server, version 20H2 (Server Core Installation)
Microsoft Edge (Chromium-based)
Microsoft 365 Apps for Enterprise for 32-bit Systems
Windows Server 2022
Windows Server 2012
Accessibility Insights for Android
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Microsoft Dynamics 365 Business Central 2020 Release Wave 2 â€“ Update 17.10
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows 10 Version 1909 for ARM64-based Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Microsoft Visual Studio 2019 version 16.11 (includes 16.0 - 16.10)
MPEG-2 Video Extension
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 2004 for 32-bit Systems
Windows Server 2019 (Server Core installation)
Windows Server 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft Dynamics 365 Business Central 2021 Release Wave 1 - Update 18.5

MS22-APR: Microsoft Windows Security Update

High

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2022-22008 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2022-22009 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2022-21983 - Win32 Stream Enumeration Remote Code Execution Vulnerability
CVE-2022-23257 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2022-23268 - Windows Hyper-V Denial of Service Vulnerability
CVE-2022-23292 - Microsoft Power BI Spoofing Vulnerability
CVE-2022-24513 - Visual Studio Elevation of Privilege Vulnerability
CVE-2022-24521 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2022-24474 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2022-24523 - Microsoft Edge (Chromium-based) Spoofing Vulnerability
CVE-2022-24475 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-24484 - Windows Cluster Shared Volume (CSV) Denial of Service Vulnerability
CVE-2022-24533 - Remote Desktop Protocol Remote Code Execution Vulnerability
CVE-2022-24485 - Win32 File Enumeration Remote Code Execution Vulnerability
CVE-2022-24534 - Win32 Stream Enumeration Remote Code Execution Vulnerability
CVE-2022-24486 - Windows Kerberos Elevation of Privilege Vulnerability
CVE-2022-24544 - Windows Kerberos Elevation of Privilege Vulnerability
CVE-2022-24496 - Local Security Authority (LSA) Elevation of Privilege Vulnerability

CVE-2022-24545 - Windows Kerberos Remote Code Execution Vulnerability
CVE-2022-24548 - Microsoft Defender Denial of Service Vulnerability
CVE-2022-24549 - Windows AppX Package Manager Elevation of Privilege Vulnerability
CVE-2022-24500 - Windows SMB Remote Code Execution Vulnerability
CVE-2022-24550 - Windows Telephony Server Elevation of Privilege Vulnerability
CVE-2022-26786 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26787 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26788 - PowerShell Elevation of Privilege Vulnerability
CVE-2022-26789 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26790 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26791 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26792 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26793 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26794 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26795 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26796 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26797 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26798 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26811 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26812 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26813 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26891 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-26894 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-26895 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-26896 - Azure Site Recovery Information Disclosure Vulnerability
CVE-2022-26897 - Azure Site Recovery Information Disclosure Vulnerability
CVE-2022-26898 - Azure Site Recovery Remote Code Execution Vulnerability
CVE-2022-26900 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-26904 - Windows User Profile Service Elevation of Privilege Vulnerability
CVE-2022-26914 - Win32k Elevation of Privilege Vulnerability
CVE-2022-26915 - Windows Secure Channel Denial of Service Vulnerability
CVE-2022-26916 - Windows Fax Compose Form Remote Code Execution Vulnerability
CVE-2022-26917 - Windows Fax Compose Form Remote Code Execution Vulnerability
CVE-2022-26918 - Windows Fax Compose Form Remote Code Execution Vulnerability
CVE-2022-26919 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-26920 - Windows Graphics Component Information Disclosure Vulnerability
CVE-2022-23259 - Microsoft Dynamics 365 (on-premises) Remote Code Execution Vulnerability
CVE-2022-24527 - Windows Endpoint Configuration Manager Elevation of Privilege Vulnerability
CVE-2022-24479 - Connected User Experiences and Telemetry Elevation of Privilege Vulnerability
CVE-2022-24528 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2022-24481 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2022-24530 - Windows Installer Elevation of Privilege Vulnerability
CVE-2022-24482 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2022-24532 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-24483 - Windows Kernel Information Disclosure Vulnerability
CVE-2022-24487 - Windows Local Security Authority (LSA) Remote Code Execution Vulnerability
CVE-2022-24536 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-24488 - Windows Desktop Bridge Elevation of Privilege Vulnerability
CVE-2022-24537 - Windows Hyper-V Remote Code Execution Vulnerability

CVE-2022-24489 - Cluster Client Failover (CCF) Elevation of Privilege Vulnerability
CVE-2022-24538 - Windows Cluster Shared Volume (CSV) Denial of Service Vulnerability
CVE-2022-24490 - Windows Hyper-V Shared Virtual Hard Disks Information Disclosure Vulnerability
CVE-2022-24539 - Windows Hyper-V Shared Virtual Hard Disks Information Disclosure Vulnerability
CVE-2022-24491 - Windows Network File System Remote Code Execution Vulnerability
CVE-2022-24540 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2022-24492 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2022-24541 - Windows Server Service Remote Code Execution Vulnerability
CVE-2022-24493 - Microsoft Local Security Authority (LSA) Server Information Disclosure Vulnerability
CVE-2022-24542 - Windows Win32k Elevation of Privilege Vulnerability
CVE-2022-24494 - Windows Ancillary Function Driver for WinSock Elevation of Privilege Vulnerability
CVE-2022-24543 - Windows Upgrade Assistant Remote Code Execution Vulnerability
CVE-2022-24495 - Windows Direct Show - Remote Code Execution Vulnerability
CVE-2022-24497 - Windows Network File System Remote Code Execution Vulnerability
CVE-2022-24546 - Windows DWM Core Library Elevation of Privilege Vulnerability
CVE-2022-24498 - Windows iSCSI Target Service Information Disclosure Vulnerability
CVE-2022-24547 - Windows Digital Media Receiver Elevation of Privilege Vulnerability
CVE-2022-24499 - Windows Installer Elevation of Privilege Vulnerability
CVE-2022-26783 - Windows Hyper-V Shared Virtual Hard Disks Information Disclosure Vulnerability
CVE-2022-26784 - Windows Cluster Shared Volume (CSV) Denial of Service Vulnerability
CVE-2022-26785 - Windows Hyper-V Shared Virtual Hard Disks Information Disclosure Vulnerability
CVE-2022-26801 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26802 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26803 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-26807 - Windows Work Folder Service Elevation of Privilege Vulnerability
CVE-2022-26808 - Windows File Explorer Elevation of Privilege Vulnerability
CVE-2022-26809 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2022-26810 - Windows File Server Resource Management Service Elevation of Privilege Vulnerability
CVE-2022-26814 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26815 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26816 - Windows DNS Server Information Disclosure Vulnerability
CVE-2022-26817 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26818 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26819 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26820 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26821 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26822 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26823 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26824 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26825 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26826 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26827 - Windows File Server Resource Management Service Elevation of Privilege Vulnerability
CVE-2022-26828 - Windows Bluetooth Driver Elevation of Privilege Vulnerability
CVE-2022-26829 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-26830 - DiskUsage.exe Remote Code Execution Vulnerability
CVE-2022-26831 - Windows LDAP Denial of Service Vulnerability
CVE-2022-24765 - GitHub: Uncontrolled search for the Git directory in Git for Windows

CVE-2022-26907 - Azure SDK for .NET Information Disclosure Vulnerability
CVE-2022-26908 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-26909 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-24767 - GitHub: Git for Windows' uninstaller vulnerable to DLL hijacking when run under the SYSTEM user account
CVE-2022-26912 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-26921 - Visual Studio Code Elevation of Privilege Vulnerability
CVE-2022-26924 - YARP Denial of Service Vulnerability
CVE-2022-1125 - Chromium: CVE-2022-1125 Use after free in Portals
CVE-2022-1127 - Chromium: CVE-2022-1127 Use after free in QR Code Generator
CVE-2022-1128 - Chromium: CVE-2022-1128 Inappropriate implementation in Web Share API
CVE-2022-1129 - Chromium: CVE-2022-1129 Inappropriate implementation in Full Screen Mode
CVE-2022-1130 - Chromium: CVE-2022-1130 Insufficient validation of untrusted input in WebOTP
CVE-2022-1131 - Chromium: CVE-2022-1131 Use after free in Cast UI
CVE-2022-1133 - Chromium: CVE-2022-1133 Use after free in WebRTC
CVE-2022-1134 - Chromium: CVE-2022-1134 Type Confusion in V8
CVE-2022-1135 - Chromium: CVE-2022-1135 Use after free in Shopping Cart
CVE-2022-1136 - Chromium: CVE-2022-1136 Use after free in Tab Strip
CVE-2022-1137 - Chromium: CVE-2022-1137 Inappropriate implementation in Extensions
CVE-2022-1138 - Chromium: CVE-2022-1138 Inappropriate implementation in Web Cursor
CVE-2022-1143 - Chromium: CVE-2022-1143 Heap buffer overflow in WebUI
CVE-2022-1145 - Chromium: CVE-2022-1145 Use after free in Extensions
CVE-2022-1146 - Chromium: CVE-2022-1146 Inappropriate implementation in Resource Timing
CVE-2022-1139 - Chromium: CVE-2022-1139 Inappropriate implementation in Background Fetch API
CVE-2022-1232 - Chromium: CVE-2022-1232 Type Confusion in V8

Affected Products:
HEVC Video Extensions
Windows 11 for ARM64-based Systems
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Azure SDK for .Net
Windows Server 2019 (Server Core installation)
Windows 10 Version 21H2 for 32-bit Systems
Microsoft On-Premises Data Gateway
Microsoft Visual Studio 2019 version 16.11 (includes 16.0 - 16.10)
YARP 1.1RC
Microsoft Malware Protection Engine
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1909 for x64-based Systems
Windows 8.1 for 32-bit systems
HEVC Video Extension
Windows 10 Version 1607 for 32-bit Systems
Windows Server 2022 (Server Core installation)
Windows 10 Version 21H2 for x64-based Systems
Windows 7 for x64-based Systems Service Pack 1
Microsoft Visual Studio 2022 version 17.1
Windows Server, version 20H2 (Server Core Installation)
Windows 10 Version 1607 for x64-based Systems
Windows Server 2012 R2 (Server Core installation)

Windows RT 8.1
Microsoft Dynamics 365 (on-premises) version 9.0
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Windows 10 Version 20H2 for 32-bit Systems
Windows 10 Version 21H1 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 21H1 for 32-bit Systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 for x64-based Systems
Windows Server 2012 (Server Core installation)
Windows Server 2012 R2
Windows Server 2016
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 1909 for 32-bit Systems
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 �" 16.6)
Microsoft Visual Studio 2022 version 17.0
Azure Site Recovery VMWare to Azure
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 1809 for x64-based Systems
Windows 11 for x64-based Systems
Microsoft Edge (Chromium-based)
Visual Studio 2019 for Mac version 8.10
Windows Upgrade Assistant
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 1809 for 32-bit Systems
Visual Studio Code
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows Server 2022
Windows Server 2012
YARP 1.0
Windows Server 2019
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 for 32-bit Systems
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 21H1 for ARM64-based Systems
Windows 8.1 for x64-based systems
Windows 10 Version 21H2 for ARM64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Dynamics 365 (on-premises) version 9.1
Windows 10 Version 1909 for ARM64-based Systems

Solution Details

Microsoft has released a fix for this flaw in their April 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 9.8

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H

MS22-FEB: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their February 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2022-21971 - Windows Runtime Remote Code Execution Vulnerability
CVE-2022-21981 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2022-21974 - Roaming Security Rights Management Services Remote Code Execution Vulnerability
CVE-2022-21844 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-21926 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-21927 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-21957 - Microsoft Dynamics 365 (on-premises) Remote Code Execution Vulnerability
CVE-2022-21965 - Microsoft Teams Denial of Service Vulnerability
CVE-2022-22709 - VP9 Video Extensions Remote Code Execution Vulnerability
CVE-2022-22710 - Windows Common Log File System Driver Denial of Service Vulnerability
CVE-2022-22712 - Windows Hyper-V Denial of Service Vulnerability
CVE-2022-23254 - Microsoft Power BI Information Disclosure Vulnerability
CVE-2022-23269 - Microsoft Dynamics GP Spoofing Vulnerability
CVE-2022-23271 - Microsoft Dynamics GP Elevation Of Privilege Vulnerability
CVE-2022-23272 - Microsoft Dynamics GP Elevation Of Privilege Vulnerability
CVE-2022-23273 - Microsoft Dynamics GP Elevation Of Privilege Vulnerability
CVE-2022-23274 - Microsoft Dynamics GP Remote Code Execution Vulnerability

CVE-2022-22715 - Named Pipe File System Elevation of Privilege Vulnerability
CVE-2022-22717 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-22718 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-21984 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-21985 - Windows Remote Access Connection Manager Information Disclosure Vulnerability
CVE-2022-21986 - .NET Denial of Service Vulnerability
CVE-2022-21989 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2022-21991 - Visual Studio Code Remote Development Extension Remote Code Execution Vulnerability
CVE-2022-21992 - Windows Mobile Device Management Remote Code Execution Vulnerability
CVE-2022-21993 - Windows Services for NFS ONCRPC XDR Driver Information Disclosure Vulnerability
CVE-2022-21994 - Windows DWM Core Library Elevation of Privilege Vulnerability
CVE-2022-21995 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2022-21996 - Win32k Elevation of Privilege Vulnerability
CVE-2022-21997 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-21998 - Windows Common Log File System Driver Information Disclosure Vulnerability
CVE-2022-21999 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-22000 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2022-22001 - Windows Remote Access Connection Manager Elevation of Privilege Vulnerability
CVE-2022-22002 - Windows User Account Profile Picture Denial of Service Vulnerability
CVE-2022-23255 - Microsoft OneDrive for Android Security Feature Bypass Vulnerability
CVE-2022-23261 - Microsoft Edge (Chromium-based) Tampering Vulnerability
CVE-2022-23262 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-23263 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-0452 - Chromium: CVE-2022-0452 Use after free in Safe Browsing
CVE-2022-0453 - Chromium: CVE-2022-0453 Use after free in Reader Mode
CVE-2022-0454 - Chromium: CVE-2022-0454 Heap buffer overflow in ANGLE
CVE-2022-0455 - Chromium: CVE-2022-0455 Inappropriate implementation in Full Screen Mode
CVE-2022-0456 - Chromium: CVE-2022-0456 Use after free in Web Search
CVE-2022-0457 - Chromium: CVE-2022-0457 Type Confusion in V8
CVE-2022-0458 - Chromium: CVE-2022-0458 Use after free in Thumbnail Tab Strip
CVE-2022-0459 - Chromium: CVE-2022-0459 Use after free in Screen Capture
CVE-2022-0460 - Chromium: CVE-2022-0460 Use after free in Window Dialog
CVE-2022-0461 - Chromium: CVE-2022-0461 Policy bypass in COOP
CVE-2022-0462 - Chromium: CVE-2022-0462 Inappropriate implementation in Scroll
CVE-2022-0463 - Chromium: CVE-2022-0463 Use after free in Accessibility
CVE-2022-0464 - Chromium: CVE-2022-0464 Use after free in Accessibility
CVE-2022-0465 - Chromium: CVE-2022-0465 Use after free in Extensions
CVE-2022-0466 - Chromium: CVE-2022-0466 Inappropriate implementation in Extensions Platform
CVE-2022-0467 - Chromium: CVE-2022-0467 Inappropriate implementation in Pointer Lock
CVE-2022-0468 - Chromium: CVE-2022-0468 Use after free in Payments
CVE-2022-0469 - Chromium: CVE-2022-0469 Use after free in Cast
CVE-2022-0470 - Chromium: CVE-2022-0470 Out of bounds memory access in V8

Affected Products:
PowerBI-client JS SDK
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Windows Server, version 20H2 (Server Core Installation)

HEVC Video Extensions
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Microsoft Edge (Chromium-based)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Windows 10 Version 21H2 for x64-based Systems
Windows Server 2012 (Server Core installation)
Windows Server 2022 (Server Core installation)
Windows Server 2022
Microsoft Visual Studio 2022 version 17.0
Windows Server 2012
Windows Server 2019
Windows 7 for x64-based Systems Service Pack 1
Visual Studio Code
Microsoft Teams for iOS
.NET 5.0
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Teams Admin Center
Windows Server 2012 R2 (Server Core installation)
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows 10 Version 21H2 for ARM64-based Systems
Windows 8.1 for 32-bit systems
Visual Studio 2019 for Mac version 8.10
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 10 Version 21H2 for 32-bit Systems
Windows 11 for x64-based Systems
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Windows 10 Version 1909 for ARM64-based Systems
Microsoft Dynamics 365 (on-premises) version 9.0
Microsoft Dynamics 365 (on-premises) version 8.2
HEVC Video Extension
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Windows 11 for ARM64-based Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Microsoft Visual Studio 2019 version 16.11 (includes 16.0 - 16.10)
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
OneDrive for Android

VP9 Video Extensions
Microsoft Dynamics GP
Windows Server 2019 (Server Core installation)
Microsoft Teams for Android
Windows Server 2016
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows Server 2022 Azure Edition Core Hotpatch
.NET 6.0
Windows 10 Version 21H1 for ARM64-based Systems

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 8.8

MS22-JAN: Microsoft Windows Security Update High

Solution Details

Microsoft has released a fix for this flaw in their January 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2022-21852 - Windows DWM Core Library Elevation of Privilege Vulnerability
CVE-2021-22947 - Open Source Curl Remote Code Execution Vulnerability
CVE-2021-36976 - Libarchive Remote Code Execution Vulnerability
CVE-2022-21919 - Windows User Profile Service Elevation of Privilege Vulnerability
CVE-2022-21918 - DirectX Graphics Kernel File Denial of Service Vulnerability
CVE-2022-21917 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-21915 - Windows GDI+ Information Disclosure Vulnerability
CVE-2022-21932 - Microsoft Dynamics 365 Customer Engagement Cross-Site Scripting Vulnerability
CVE-2022-21833 - Virtual Machine IDE Drive Elevation of Privilege Vulnerability
CVE-2022-21834 - Windows User-mode Driver Framework Reflector Driver Elevation of Privilege Vulnerability
CVE-2022-21835 - Microsoft Cryptographic Services Elevation of Privilege Vulnerability
CVE-2022-21836 - Windows Certificate Spoofing Vulnerability
CVE-2022-21838 - Windows Cleanup Manager Elevation of Privilege Vulnerability
CVE-2022-21839 - Windows Event Tracing Discretionary Access Control List Denial of Service Vulnerability
CVE-2022-21857 - Active Directory Domain Services Elevation of Privilege Vulnerability
CVE-2022-21858 - Windows Bind Filter Driver Elevation of Privilege Vulnerability
CVE-2022-21859 - Windows Accounts Control Elevation of Privilege Vulnerability
CVE-2022-21860 - Windows AppContracts API Server Elevation of Privilege Vulnerability
CVE-2022-21861 - Task Flow Data Engine Elevation of Privilege Vulnerability
CVE-2022-21862 - Windows Application Model Core API Elevation of Privilege Vulnerability
CVE-2022-21863 - Windows StateRepository API Server file Elevation of Privilege Vulnerability

CVE-2022-21864 - Windows UI Immersive Server API Elevation of Privilege Vulnerability
CVE-2022-21865 - Connected Devices Platform Service Elevation of Privilege Vulnerability
CVE-2022-21866 - Windows System Launcher Elevation of Privilege Vulnerability
CVE-2022-21867 - Windows Push Notifications Apps Elevation Of Privilege Vulnerability
CVE-2022-21868 - Windows Devices Human Interface Elevation of Privilege Vulnerability
CVE-2022-21869 - Clipboard User Service Elevation of Privilege Vulnerability
CVE-2022-21870 - Tablet Windows User Interface Application Core Elevation of Privilege Vulnerability
CVE-2022-21871 - Microsoft Diagnostics Hub Standard Collector Runtime Elevation of Privilege Vulnerability
CVE-2022-21872 - Windows Event Tracing Elevation of Privilege Vulnerability
CVE-2022-21873 - Tile Data Repository Elevation of Privilege Vulnerability
CVE-2022-21874 - Windows Security Center API Remote Code Execution Vulnerability
CVE-2022-21875 - Windows Storage Elevation of Privilege Vulnerability
CVE-2022-21876 - Win32k Information Disclosure Vulnerability
CVE-2022-21877 - Storage Spaces Controller Information Disclosure Vulnerability
CVE-2022-21878 - Windows Geolocation Service Remote Code Execution Vulnerability
CVE-2022-21879 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2022-21880 - Windows GDI+ Information Disclosure Vulnerability
CVE-2022-21881 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2022-21882 - Win32k Elevation of Privilege Vulnerability
CVE-2022-21843 - Windows IKE Extension Denial of Service Vulnerability
CVE-2022-21883 - Windows IKE Extension Denial of Service Vulnerability
CVE-2022-21884 - Local Security Authority Subsystem Service Elevation of Privilege Vulnerability
CVE-2022-21885 - Windows Remote Access Connection Manager Elevation of Privilege Vulnerability
CVE-2022-21887 - Win32k Elevation of Privilege Vulnerability
CVE-2022-21888 - Windows Modern Execution Server Remote Code Execution Vulnerability
CVE-2022-21892 - Windows Resilient File System (ReFS) Remote Code Execution Vulnerability
CVE-2022-21893 - Remote Desktop Protocol Remote Code Execution Vulnerability
CVE-2022-21894 - Secure Boot Security Feature Bypass Vulnerability
CVE-2022-21900 - Windows Hyper-V Security Feature Bypass Vulnerability
CVE-2022-21901 - Windows Hyper-V Elevation of Privilege Vulnerability
CVE-2022-21902 - Windows DWM Core Library Elevation of Privilege Vulnerability
CVE-2022-21903 - Windows GDI Elevation of Privilege Vulnerability
CVE-2022-21904 - Windows GDI Information Disclosure Vulnerability
CVE-2022-21905 - Windows Hyper-V Security Feature Bypass Vulnerability
CVE-2022-21906 - Windows Defender Application Control Security Feature Bypass Vulnerability
CVE-2022-21907 - HTTP Protocol Stack Remote Code Execution Vulnerability
CVE-2022-21908 - Windows Installer Elevation of Privilege Vulnerability
CVE-2022-21910 - Microsoft Cluster Port Driver Elevation of Privilege Vulnerability
CVE-2022-21912 - DirectX Graphics Kernel Remote Code Execution Vulnerability
CVE-2022-21913 - Local Security Authority (Domain Policy) Remote Protocol Security Feature Bypass
CVE-2022-21924 - Workstation Service Remote Protocol Security Feature Bypass Vulnerability
CVE-2022-21925 - Windows BackupKey Remote Protocol Security Feature Bypass Vulnerability
CVE-2022-21958 - Windows Resilient File System (ReFS) Remote Code Execution Vulnerability
CVE-2022-21959 - Windows Resilient File System (ReFS) Remote Code Execution Vulnerability
CVE-2022-21960 - Windows Resilient File System (ReFS) Remote Code Execution Vulnerability
CVE-2022-21961 - Windows Resilient File System (ReFS) Remote Code Execution Vulnerability
CVE-2022-21962 - Windows Resilient File System (ReFS) Remote Code Execution Vulnerability
CVE-2022-21963 - Windows Resilient File System (ReFS) Remote Code Execution Vulnerability

CVE-2022-21964 - Remote Desktop Licensing Diagnoser Information Disclosure Vulnerability
CVE-2022-21847 - Windows Hyper-V Denial of Service Vulnerability
CVE-2022-21922 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2022-21921 - Windows Defender Credential Guard Security Feature Bypass Vulnerability
CVE-2022-21920 - Windows Kerberos Elevation of Privilege Vulnerability
CVE-2022-21848 - Windows IKE Extension Denial of Service Vulnerability
CVE-2022-21849 - Windows IKE Extension Remote Code Execution Vulnerability
CVE-2022-21850 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2022-21851 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2022-21916 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2022-21895 - Windows User Profile Service Elevation of Privilege Vulnerability
CVE-2022-21914 - Windows Remote Access Connection Manager Elevation of Privilege Vulnerability
CVE-2022-21889 - Windows IKE Extension Denial of Service Vulnerability
CVE-2022-21890 - Windows IKE Extension Denial of Service Vulnerability
CVE-2022-21891 - Microsoft Dynamics 365 (on-premises) Spoofing Vulnerability
CVE-2022-21896 - Windows DWM Core Library Elevation of Privilege Vulnerability
CVE-2022-21897 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2022-21898 - DirectX Graphics Kernel Remote Code Execution Vulnerability
CVE-2022-21899 - Windows Extensible Firmware Interface Security Feature Bypass Vulnerability
CVE-2022-21928 - Windows Resilient File System (ReFS) Remote Code Execution Vulnerability
CVE-2022-21929 - Microsoft Edge (Chromium-based) Remote Code Execution Vulnerability
CVE-2022-21930 - Microsoft Edge (Chromium-based) Remote Code Execution Vulnerability
CVE-2022-21931 - Microsoft Edge (Chromium-based) Remote Code Execution Vulnerability
CVE-2022-21954 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-21970 - Microsoft Edge (Chromium-based) Elevation of Privilege Vulnerability
CVE-2022-0096 - Chromium: CVE-2022-0096 Use after free in Storage
CVE-2022-0097 - Chromium: CVE-2022-0097 Inappropriate implementation in DevTools
CVE-2022-0098 - Chromium: CVE-2022-0098 Use after free in Screen Capture
CVE-2022-0099 - Chromium: CVE-2022-0099 Use after free in Sign-in
CVE-2022-0100 - Chromium: CVE-2022-0100 Heap buffer overflow in Media streams API
CVE-2022-0101 - Chromium: CVE-2022-0101 Heap buffer overflow in Bookmarks
CVE-2022-0102 - Chromium: CVE-2022-0102 Type Confusion in V8
CVE-2022-0103 - Chromium: CVE-2022-0103 Use after free in SwiftShader
CVE-2022-0104 - Chromium: CVE-2022-0104 Heap buffer overflow in ANGLE
CVE-2022-0105 - Chromium: CVE-2022-0105 Use after free in PDF
CVE-2022-0106 - Chromium: CVE-2022-0106 Use after free in Autofill
CVE-2022-0107 - Chromium: CVE-2022-0107 Use after free in File Manager API
CVE-2022-0108 - Chromium: CVE-2022-0108 Inappropriate implementation in Navigation
CVE-2022-0109 - Chromium: CVE-2022-0109 Inappropriate implementation in Autofill
CVE-2022-0110 - Chromium: CVE-2022-0110 Incorrect security UI in Autofill
CVE-2022-0111 - Chromium: CVE-2022-0111 Inappropriate implementation in Navigation
CVE-2022-0112 - Chromium: CVE-2022-0112 Incorrect security UI in Browser UI
CVE-2022-0113 - Chromium: CVE-2022-0113 Inappropriate implementation in Blink
CVE-2022-0114 - Chromium: CVE-2022-0114 Out of bounds memory access in Web Serial
CVE-2022-0115 - Chromium: CVE-2022-0115 Uninitialized Use in File API
CVE-2022-0116 - Chromium: CVE-2022-0116 Inappropriate implementation in Compositing
CVE-2022-0117 - Chromium: CVE-2022-0117 Policy bypass in Service Workers
CVE-2022-0118 - Chromium: CVE-2022-0118 Inappropriate implementation in WebShare
CVE-2022-0120 - Chromium: CVE-2022-0120 Inappropriate implementation in Passwords

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
HEVC Video Extensions
Windows 10 for 32-bit Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for 32-bit Systems
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 21H1 for 32-bit Systems
Windows Server 2012 (Server Core installation)
Windows Server 2022 (Server Core installation)
Windows Server 2019
Windows 8.1 for x64-based systems
Windows 10 Version 21H2 for ARM64-based Systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows 11 for x64-based Systems
Dynamics 365 Sales
Windows 10 Version 1607 for x64-based Systems
Windows Server 2016 (Server Core installation)
Windows 10 Version 1809 for 32-bit Systems
Remote Desktop client for Windows Desktop
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 10 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft Dynamics 365 Customer Engagement V9.1
Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 21H1 for ARM64-based Systems
Windows Server, version 20H2 (Server Core Installation)
Microsoft Edge (Chromium-based)
Windows 10 Version 21H2 for x64-based Systems
Windows Server 2022
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2012 R2 (Server Core installation)
Windows Server 2012 R2
Windows 8.1 for 32-bit systems
Windows 10 Version 21H2 for 32-bit Systems
Windows 10 Version 1909 for ARM64-based Systems
Windows 11 for ARM64-based Systems
Windows RT 8.1
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1909 for 32-bit Systems
Windows Server 2019 (Server Core installation)

Windows Server 2016
Microsoft Dynamics 365 Customer Engagement V9.0
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

CVSS Base Score: 9.8

MS22-JUL: Microsoft Windows Security Update

High

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2022-21845 - Windows Kernel Information Disclosure Vulnerability
CVE-2022-22711 - Windows BitLocker Information Disclosure Vulnerability
CVE-2022-30181 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33637 - Microsoft Defender for Endpoint Tampering Vulnerability
CVE-2022-33641 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33642 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33643 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-30187 - Azure Storage Library Information Disclosure Vulnerability
CVE-2022-30202 - Windows Advanced Local Procedure Call Elevation of Privilege Vulnerability
CVE-2022-30203 - Windows Boot Manager Security Feature Bypass Vulnerability
CVE-2022-30205 - Windows Group Policy Elevation of Privilege Vulnerability
CVE-2022-30206 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-30208 - Windows Security Account Manager (SAM) Denial of Service Vulnerability
CVE-2022-30209 - Windows IIS Server Elevation of Privilege Vulnerability
CVE-2022-30211 - Windows Layer 2 Tunneling Protocol (L2TP) Remote Code Execution Vulnerability
CVE-2022-30212 - Windows Connected Devices Platform Service Information Disclosure Vulnerability
CVE-2022-30213 - Windows GDI+ Information Disclosure Vulnerability
CVE-2022-30214 - Windows DNS Server Remote Code Execution Vulnerability
CVE-2022-30215 - Active Directory Federation Services Elevation of Privilege Vulnerability
CVE-2022-30216 - Windows Server Service Tampering Vulnerability
CVE-2022-30220 - Windows Common Log File System Driver Elevation of Privilege Vulnerability
CVE-2022-30221 - Windows Graphics Component Remote Code Execution Vulnerability
CVE-2022-30222 - Windows Shell Remote Code Execution Vulnerability
CVE-2022-30223 - Windows Hyper-V Information Disclosure Vulnerability
CVE-2022-30224 - Windows Advanced Local Procedure Call Elevation of Privilege Vulnerability
CVE-2022-30225 - Windows Media Player Network Sharing Service Elevation of Privilege Vulnerability
CVE-2022-30226 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-22022 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-22023 - Windows Portable Device Enumerator Service Security Feature Bypass Vulnerability
CVE-2022-22024 - Windows Fax Service Remote Code Execution Vulnerability
CVE-2022-22025 - Windows Internet Information Services Cachuri Module Denial of Service Vulnerability
CVE-2022-22026 - Windows CSRSS Elevation of Privilege Vulnerability
CVE-2022-22027 - Windows Fax Service Remote Code Execution Vulnerability
CVE-2022-22028 - Windows Network File System Information Disclosure Vulnerability
CVE-2022-22029 - Windows Network File System Remote Code Execution Vulnerability
CVE-2022-22031 - Windows Credential Guard Domain-joined Public Key Elevation of Privilege

Vulnerability
CVE-2022-22034 - Windows Graphics Component Elevation of Privilege Vulnerability
CVE-2022-22036 - Performance Counters for Windows Elevation of Privilege Vulnerability
CVE-2022-22037 - Windows Advanced Local Procedure Call Elevation of Privilege Vulnerability
CVE-2022-22038 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2022-22039 - Windows Network File System Remote Code Execution Vulnerability
CVE-2022-22040 - Internet Information Services Dynamic Compression Module Denial of Service Vulnerability
CVE-2022-22041 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-22042 - Windows Hyper-V Information Disclosure Vulnerability
CVE-2022-22043 - Windows Fast FAT File System Driver Elevation of Privilege Vulnerability
CVE-2022-22045 - Windows.Devices.Picker.dll Elevation of Privilege Vulnerability
CVE-2022-22047 - Windows CSRSS Elevation of Privilege Vulnerability
CVE-2022-22048 - BitLocker Security Feature Bypass Vulnerability
CVE-2022-22049 - Windows CSRSS Elevation of Privilege Vulnerability
CVE-2022-22050 - Windows Fax Service Elevation of Privilege Vulnerability
CVE-2022-27776 - HackerOne: CVE-2022-27776 Insufficiently protected credentials vulnerability might leak authentication or cookie header data
CVE-2022-33644 - Xbox Live Save Service Elevation of Privilege Vulnerability
CVE-2022-33650 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-23816 - AMD: CVE-2022-23816 AMD CPU Branch Type Confusion
CVE-2022-33651 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33652 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33653 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33654 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33655 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33656 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33657 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33658 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33659 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33660 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33661 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33662 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33663 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33664 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33665 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33666 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33667 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33668 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33669 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33671 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33672 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-23825 - AMD: CVE-2022-23825 AMD CPU Branch Type Confusion
CVE-2022-33673 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33674 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33675 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33676 - Azure Site Recovery Remote Code Execution Vulnerability
CVE-2022-33677 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-33678 - Azure Site Recovery Remote Code Execution Vulnerability

CVE-2022-2294 - Chromium: CVE-2022-2294 Heap buffer overflow in WebRTC
CVE-2022-2295 - Chromium: CVE-2022-2295 Type Confusion in V8

Affected Products:
Windows Server 2012 (Server Core installation)
Windows 11 for ARM64-based Systems
Windows 10 Version 1809 for 32-bit Systems
Windows Server 2016
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for x64-based Systems
Azure Storage Queues client library for .NET
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 21H1 for 32-bit Systems
Windows 10 Version 1607 for x64-based Systems
Azure Storage Queues client library for Python
Windows Server 2012 R2 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 8.1 for x64-based systems
Microsoft Defender for Endpoint for Linux
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows Server 2019 (Server Core installation)
Windows 10 Version 21H2 for ARM64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows 7 for 32-bit Systems Service Pack 1
Windows Server 2016 (Server Core installation)
Windows 10 Version 21H2 for x64-based Systems
Windows 11 for x64-based Systems
Windows 8.1 for 32-bit systems
Windows 10 Version 21H1 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 21H1 for ARM64-based Systems
Windows Server 2012
Windows Server, version 20H2 (Server Core Installation)
Azure Storage Blobs client library for Python
Windows Server 2019
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Edge (Chromium-based)
Windows Server 2022
Azure Storage Blobs client library for Java
Azure Storage Blobs client library for .NET
Windows 10 Version 21H2 for 32-bit Systems
Windows 7 for x64-based Systems Service Pack 1
Windows 10 Version 1809 for x64-based Systems
Remote Desktop client for Windows Desktop
Windows 10 for 32-bit Systems
Windows Server 2022 (Server Core installation)
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 20H2 for ARM64-based Systems

Windows Server 2012 R2
Azure Site Recovery VMWare to Azure
Windows 10 Version 20H2 for 32-bit Systems
Windows RT 8.1

Solution Details

Microsoft has released a fix for this flaw in their July 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 8.8

MS22-JUN: Microsoft SQL Server Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their June 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft SQL Server which include fixes for the following vulnerabilities:

CVE-2022-29143 - Microsoft SQL Server Remote Code Execution Vulnerability

Affected Products:
Microsoft SQL Server 2016 for x64-based Systems Service Pack 2 (CU 17)
Microsoft SQL Server 2017 for x64-based Systems (GDR)

Microsoft SQL Server 2017 for x64-based Systems (CU 29)
Microsoft SQL Server 2014 Service Pack 3 for 32-bit Systems (GDR)
Microsoft SQL Server 2014 Service Pack 3 for 32-bit Systems (CU 4)
Microsoft SQL Server 2014 Service Pack 3 for x64-based Systems (GDR)
Microsoft SQL Server 2019 for x64-based Systems (GDR)
Microsoft SQL Server 2016 for x64-based Systems Service Pack 3 (GDR)
Microsoft SQL Server 2016 for x64-based Systems Service Pack 2 (GDR)
Microsoft SQL Server 2019 for x64-based Systems (CU 16)
Microsoft SQL Server 2014 Service Pack 3 for x64-based Systems (CU 4)
Microsoft SQL Server 2016 for x64-based Systems Service Pack 3 Azure Connectivity Pack

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

MS22-JUN: Microsoft Windows Security Update High

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2022-21166 - Intel: CVE-2022-21166 Device Register Partial Write (DRPW)
CVE-2022-21127 - Intel: CVE-2022-21127 Special Register Buffer Data Sampling Update (SRBDS Update)
CVE-2022-21123 - Intel: CVE-2022-21123 Shared Buffers Data Read (SBDR)
CVE-2022-21125 - Intel: CVE-2022-21125 Shared Buffers Data Sampling (SBDS)
CVE-2022-29111 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-29149 - Azure Open Management Infrastructure (OMI) Elevation of Privilege Vulnerability
CVE-2022-22018 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-22021 - Microsoft Edge (Chromium-based) Remote Code Execution Vulnerability
CVE-2022-30131 - Windows Container Isolation FS Filter Driver Elevation of Privilege Vulnerability
CVE-2022-30132 - Windows Container Manager Service Elevation of Privilege Vulnerability
ADV220002 - Microsoft Guidance on Intel Processor MMIO Stale Data Vulnerabilities
CVE-2022-30135 - Windows Media Center Elevation of Privilege Vulnerability
CVE-2022-30136 - Windows Network File System Remote Code Execution Vulnerability
CVE-2022-30137 - Azure Service Fabric Container Elevation of Privilege Vulnerability
CVE-2022-30140 - Windows iSCSI Discovery Service Remote Code Execution Vulnerability
CVE-2022-30141 - Windows Lightweight Directory Access Protocol (LDAP) Remote Code Execution Vulnerability
CVE-2022-30142 - Windows File History Remote Code Execution Vulnerability
CVE-2022-30143 - Windows Lightweight Directory Access Protocol (LDAP) Remote Code Execution Vulnerability
CVE-2022-30145 - Windows Encrypting File System (EFS) Remote Code Execution Vulnerability
CVE-2022-30148 - Windows Desired State Configuration (DSC) Information Disclosure Vulnerability
CVE-2022-30149 - Windows Lightweight Directory Access Protocol (LDAP) Remote Code Execution Vulnerability
CVE-2022-30150 - Windows Defender Remote Credential Guard Elevation of Privilege Vulnerability
CVE-2022-30151 - Windows Ancillary Function Driver for WinSock Elevation of Privilege Vulnerability
CVE-2022-30152 - Windows Network Address Translation (NAT) Denial of Service Vulnerability
CVE-2022-30153 - Windows Lightweight Directory Access Protocol (LDAP) Remote Code Execution Vulnerability
CVE-2022-30154 - Microsoft File Server Shadow Copy Agent Service (RVSS) Elevation of Privilege Vulnerability
CVE-2022-30155 - Windows Kernel Denial of Service Vulnerability
CVE-2022-30160 - Windows Advanced Local Procedure Call Elevation of Privilege Vulnerability
CVE-2022-30161 - Windows Lightweight Directory Access Protocol (LDAP) Remote Code Execution Vulnerability
CVE-2022-30162 - Windows Kernel Information Disclosure Vulnerability
CVE-2022-30163 - Windows Hyper-V Remote Code Execution Vulnerability
CVE-2022-30164 - Kerberos AppContainer Security Feature Bypass Vulnerability
CVE-2022-30167 - AV1 Video Extension Remote Code Execution Vulnerability
CVE-2022-30177 - Azure RTOS GUIX Studio Remote Code Execution Vulnerability
CVE-2022-30178 - Azure RTOS GUIX Studio Remote Code Execution Vulnerability
CVE-2022-30179 - Azure RTOS GUIX Studio Remote Code Execution Vulnerability
CVE-2022-30180 - Azure RTOS GUIX Studio Information Disclosure Vulnerability
CVE-2022-30184 - .NET and Visual Studio Information Disclosure Vulnerability
CVE-2022-30188 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-29119 - HEVC Video Extensions Remote Code Execution Vulnerability

CVE-2022-30139 - Windows Lightweight Directory Access Protocol (LDAP) Remote Code Execution Vulnerability
CVE-2022-30146 - Windows Lightweight Directory Access Protocol (LDAP) Remote Code Execution Vulnerability
CVE-2022-30147 - Windows Installer Elevation of Privilege Vulnerability
CVE-2022-30165 - Windows Kerberos Elevation of Privilege Vulnerability
CVE-2022-30166 - Local Security Authority Subsystem Service Elevation of Privilege Vulnerability
CVE-2022-30168 - Microsoft Photos App Remote Code Execution Vulnerability
CVE-2022-30189 - Windows Autopilot Device Management and Enrollment Client Spoofing Vulnerability
CVE-2022-30190 - Microsoft Windows Support Diagnostic Tool Remote Code Execution Vulnerability
CVE-2022-32230 - Windows SMB Denial of Service Vulnerability
CVE-2022-30193 - AV1 Video Extension Remote Code Execution Vulnerability
CVE-2022-2007 - Chromium: CVE-2022-2007 Use after free in WebGPU
CVE-2022-2008 - Chromium: CVE-2022-2008 Out of bounds memory access in WebGL
CVE-2022-2010 - Chromium: CVE-2022-2010 Out of bounds read in compositing
CVE-2022-2011 - Chromium: CVE-2022-2011 Use after free in ANGLE

Affected Products:
.NET 6.0
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 1809 for 32-bit Systems
Azure Automation State Configuration, DSC Extension
Windows Server 2022
Windows Server 2019
Windows 10 Version 20H2 for ARM64-based Systems
Azure Automation Update Management
Windows Server 2012 (Server Core installation)
Windows Server, version 20H2 (Server Core Installation)
Windows Server 2022 Azure Edition Core Hotpatch
Windows 10 Version 21H2 for 32-bit Systems
Windows Server 2019 (Server Core installation)
Windows Server 2022 (Server Core installation)
Windows Server 2016
AV1 Video Extension
Visual Studio 2022 for Mac version 17.0
.NET Core 3.1
Azure Security Center
Windows 10 Version 21H2 for x64-based Systems
Microsoft Photos
Windows 10 Version 20H2 for 32-bit Systems
Windows 10 Version 21H2 for ARM64-based Systems
Windows Server 2012 R2 (Server Core installation)
Windows 7 for 32-bit Systems Service Pack 1
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Visual Studio 2019 for Mac version 8.10
Windows 10 Version 1607 for 32-bit Systems
Azure Real Time Operating System GUIX

Windows 11 for x64-based Systems
Windows 8.1 for 32-bit systems
Windows 8.1 for x64-based systems
Microsoft Visual Studio 2022 version 17.0
System Center Operations Manager (SCOM) 2016
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows RT 8.1
Windows Server 2012 R2
Microsoft Edge (Chromium-based)
HEVC Video Extensions
Windows 10 Version 1809 for x64-based Systems
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
NuGet.exe
System Center Operations Manager (SCOM) 2019
Log Analytics Agent
Azure Stack Hub
Windows 10 Version 21H1 for 32-bit Systems
Azure Diagnostics (LAD)
Windows 11 for ARM64-based Systems
Windows 10 for 32-bit Systems
Container Monitoring Solution
System Center Operations Manager (SCOM) 2022
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Windows 7 for x64-based Systems Service Pack 1
Microsoft Visual Studio 2019 version 16.11 (includes 16.0 - 16.10)
Azure Real Time Operating System
Azure Sentinel
Windows 10 Version 21H1 for ARM64-based Systems
Microsoft Visual Studio 2022 version 17.2
Azure Service Fabric
Windows Server 2008 for x64-based Systems Service Pack 2
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 for x64-based Systems
HEVC Video Extension
Azure Open Management Infrastructure
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows Server 2012
Windows 10 Version 21H1 for x64-based Systems
Windows Server 2016 (Server Core installation)

Solution Details

Microsoft has released a fix for this flaw in their June 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS22-MAR: Microsoft Internet Explorer Security Update High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their March 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2022-21977 - Media Foundation Information Disclosure Vulnerability
CVE-2022-22010 - Media Foundation Information Disclosure Vulnerability
CVE-2022-23299 - Windows PDEV Elevation of Privilege Vulnerability
CVE-2022-24502 - Windows HTML Platforms Security Feature Bypass Vulnerability
CVE-2022-23283 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2022-23285 - Remote Desktop Client Remote Code Execution Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 Version 1909 for x64-based Systems
Windows Server 2022 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 1809 for 32-bit Systems
Windows 10 Version 1607 for 32-bit Systems
Windows Server 2012 (Server Core installation)
Windows 10 Version 21H1 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 1909 for 32-bit Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows 11 for x64-based Systems
Windows Server 2016
Windows 10 Version 20H2 for 32-bit Systems
Windows 10 Version 21H2 for x64-based Systems
Windows Server 2022
Windows 10 Version 21H1 for x64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows RT 8.1
Windows 8.1 for x64-based systems
Windows 10 Version 21H2 for ARM64-based Systems
Windows Server 2012 R2 (Server Core installation)
Windows 10 for x64-based Systems
Windows 10 for 32-bit Systems
Windows Server 2016 (Server Core installation)
Windows Server 2012
Windows Server 2019
Windows 11 for ARM64-based Systems
Windows 10 Version 21H2 for 32-bit Systems
Windows 8.1 for 32-bit systems
Windows Server 2022 Azure Edition Core Hotpatch
Windows 10 Version 20H2 for x64-based Systems
Windows 10 Version 1607 for x64-based Systems
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 1809 for x64-based Systems
Windows Server 2012 R2
Windows 10 Version 21H1 for 32-bit Systems
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1909 for ARM64-based Systems
Windows 7 for x64-based Systems Service Pack 1
Windows 10 Version 20H2 for ARM64-based Systems
Windows Server, version 20H2 (Server Core Installation)

MS22-MAR: Microsoft Windows Security Update — High

Solution Details

Microsoft has released a fix for this flaw in their March 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2022-21967 - Xbox Live Auth Manager for Windows Elevation of Privilege Vulnerability
CVE-2022-21975 - Windows Hyper-V Denial of Service Vulnerability
CVE-2022-21990 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2022-23265 - Microsoft Defender for IoT Remote Code Execution Vulnerability
CVE-2022-23266 - Microsoft Defender for IoT Elevation of Privilege Vulnerability
CVE-2022-23290 - Windows Inking COM Elevation of Privilege Vulnerability
CVE-2022-23291 - Windows DWM Core Library Elevation of Privilege Vulnerability
CVE-2022-23293 - Windows Fast FAT File System Driver Elevation of Privilege Vulnerability
CVE-2022-23294 - Windows Event Tracing Remote Code Execution Vulnerability
CVE-2022-23295 - Raw Image Extension Remote Code Execution Vulnerability
CVE-2022-23296 - Windows Installer Elevation of Privilege Vulnerability
CVE-2022-23298 - Windows NT OS Kernel Elevation of Privilege Vulnerability
CVE-2022-23300 - Raw Image Extension Remote Code Execution Vulnerability
CVE-2022-23301 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-22006 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-22007 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-24451 - VP9 Video Extensions Remote Code Execution Vulnerability

CVE-2022-24452 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-24453 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-24501 - VP9 Video Extensions Remote Code Execution Vulnerability
CVE-2022-24454 - Windows Security Support Provider Interface Elevation of Privilege Vulnerability
CVE-2022-24503 - Remote Desktop Protocol Client Information Disclosure Vulnerability
CVE-2022-24455 - Windows CD-ROM Driver Elevation of Privilege Vulnerability
CVE-2022-24456 - HEVC Video Extensions Remote Code Execution Vulnerability
CVE-2022-24457 - HEIF Image Extensions Remote Code Execution Vulnerability
CVE-2022-24506 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-24507 - Windows Ancillary Function Driver for WinSock Elevation of Privilege Vulnerability
CVE-2022-24459 - Windows Fax and Scan Service Elevation of Privilege Vulnerability
CVE-2022-24512 - .NET and Visual Studio Remote Code Execution Vulnerability
CVE-2022-24464 - .NET and Visual Studio Denial of Service Vulnerability
CVE-2022-24465 - Microsoft Intune Portal for iOS Security Feature Bypass Vulnerability
CVE-2022-24515 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-24467 - Azure Site Recovery Remote Code Execution Vulnerability
CVE-2022-24522 - Skype Extension for Chrome Information Disclosure Vulnerability
CVE-2022-21973 - Windows Media Center Update Denial of Service Vulnerability
CVE-2022-23253 - Point-to-Point Tunneling Protocol Denial of Service Vulnerability
CVE-2022-23278 - Microsoft Defender for Endpoint Spoofing Vulnerability
CVE-2022-23281 - Windows Common Log File System Driver Information Disclosure Vulnerability
CVE-2022-23282 - Paint 3D Remote Code Execution Vulnerability
CVE-2022-23284 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-23286 - Windows Cloud Files Mini Filter Driver Elevation of Privilege Vulnerability
CVE-2022-23287 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2022-23288 - Windows DWM Core Library Elevation of Privilege Vulnerability
CVE-2022-23297 - Windows NT Lan Manager Datagram Receiver Driver Information Disclosure Vulnerability
CVE-2022-24505 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2022-24508 - Windows SMBv3 Client/Server Remote Code Execution Vulnerability
CVE-2022-24460 - Tablet Windows User Interface Application Elevation of Privilege Vulnerability
CVE-2022-24468 - Azure Site Recovery Remote Code Execution Vulnerability
CVE-2022-24469 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-24517 - Azure Site Recovery Remote Code Execution Vulnerability
CVE-2022-24470 - Azure Site Recovery Remote Code Execution Vulnerability
CVE-2022-24518 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-24519 - Azure Site Recovery Elevation of Privilege Vulnerability
CVE-2022-24471 - Azure Site Recovery Remote Code Execution Vulnerability
CVE-2022-24520 - Azure Site Recovery Remote Code Execution Vulnerability
CVE-2020-8927 - Brotli Library Buffer Overflow Vulnerability
CVE-2022-24525 - Windows Update Stack Elevation of Privilege Vulnerability
CVE-2022-24526 - Visual Studio Code Spoofing Vulnerability
CVE-2022-0789 - Chromium: CVE-2022-0789 Heap buffer overflow in ANGLE
CVE-2022-0790 - Chromium: CVE-2022-0790 Use after free in Cast UI
CVE-2022-0791 - Chromium: CVE-2022-0791 Use after free in Omnibox
CVE-2022-0792 - Chromium: CVE-2022-0792 Out of bounds read in ANGLE
CVE-2022-0793 - Chromium: CVE-2022-0793 Use after free in Views
CVE-2022-0794 - Chromium: CVE-2022-0794 Use after free in WebShare
CVE-2022-0795 - Chromium: CVE-2022-0795 Type Confusion in Blink Layout

CVE-2022-0796 - Chromium: CVE-2022-0796 Use after free in Media
CVE-2022-0797 - Chromium: CVE-2022-0797 Out of bounds memory access in Mojo
CVE-2022-0798 - Chromium: CVE-2022-0798 Use after free in MediaStream
CVE-2022-0799 - Chromium: CVE-2022-0799 Insufficient policy enforcement in Installer
CVE-2022-0800 - Chromium: CVE-2022-0800 Heap buffer overflow in Cast UI
CVE-2022-0801 - Chromium: CVE-2022-0801 Inappropriate implementation in HTML parser
CVE-2022-0802 - Chromium: CVE-2022-0802 Inappropriate implementation in Full screen mode
CVE-2022-0803 - Chromium: CVE-2022-0803 Inappropriate implementation in Permissions
CVE-2022-0804 - Chromium: CVE-2022-0804 Inappropriate implementation in Full screen mode
CVE-2022-0805 - Chromium: CVE-2022-0805 Use after free in Browser Switcher
CVE-2022-0806 - Chromium: CVE-2022-0806 Data leak in Canvas
CVE-2022-0807 - Chromium: CVE-2022-0807 Inappropriate implementation in Autofill
CVE-2022-0808 - Chromium: CVE-2022-0808 Use after free in Chrome OS Shell
CVE-2022-0809 - Chromium: CVE-2022-0809 Out of bounds memory access in WebXR

Affected Products:
Microsoft Defender for Endpoint for Windows on Windows 10 Version 20H2 for ARM64-based Systems
Microsoft Defender for Endpoint for Windows on Windows 10 Version 21H1 for x64-based Systems
Windows 10 Version 20H2 for ARM64-based Systems
Windows 7 for x64-based Systems Service Pack 1
Microsoft Defender for Endpoint for Windows on Windows 10 Version 20H2 for x64-based Systems

Windows 7 for 32-bit Systems Service Pack 1
Microsoft Defender for Endpoint for Windows on Windows 10 Version 1607 for 32-bit Systems
Microsoft Defender for Endpoint for Windows on Windows 10 Version 21H2 for ARM64-based Systems
Microsoft Defender for Endpoint for Windows on Windows 10 Version 1607 for x64-based Systems
Microsoft Visual Studio 2019 version 16.7 (includes 16.0 �" 16.6)
Windows 10 Version 1607 for 32-bit Systems
Windows Server 2012 (Server Core installation)
Microsoft Defender for Endpoint for Windows on Windows 10 Version 21H1 for 32-bit Systems
Microsoft Defender for Endpoint for Windows on Windows 10 Version 1809 for 32-bit Systems
Raw Image Extension
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows 10 Version 1809 for 32-bit Systems
Microsoft Defender for Endpoint for Windows on Windows Server 2012 R2
Windows 10 Version 21H1 for ARM64-based Systems
Windows 10 Version 1909 for x64-based Systems
Windows Server 2022 (Server Core installation)
Microsoft Defender for Endpoint for Windows on Windows Server 2016
Microsoft Defender for Endpoint for Windows on Windows 10 for x64-based Systems

False Positive Notes

MS22-MAY: Microsoft Windows Security Update — High

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their May 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2022-21972 - Point-to-Point Tunneling Protocol Remote Code Execution Vulnerability
CVE-2022-22713 - Windows Hyper-V Denial of Service Vulnerability
CVE-2022-23267 - .NET and Visual Studio Denial of Service Vulnerability
CVE-2022-23270 - Point-to-Point Tunneling Protocol Remote Code Execution Vulnerability
CVE-2022-24466 - Windows Hyper-V Security Feature Bypass Vulnerability
CVE-2022-26913 - Windows Authentication Security Feature Bypass Vulnerability
CVE-2022-26925 - Windows LSA Spoofing Vulnerability

CVE-2022-26926 - Windows Address Book Remote Code Execution Vulnerability
CVE-2022-26927 - Windows Graphics Component Remote Code Execution Vulnerability
CVE-2022-26930 - Windows Remote Access Connection Manager Information Disclosure Vulnerability
CVE-2022-26931 - Windows Kerberos Elevation of Privilege Vulnerability
CVE-2022-26932 - Storage Spaces Direct Elevation of Privilege Vulnerability
CVE-2022-26933 - Windows NTFS Information Disclosure Vulnerability
CVE-2022-26934 - Windows Graphics Component Information Disclosure Vulnerability
CVE-2022-26935 - Windows WLAN AutoConfig Service Information Disclosure Vulnerability
CVE-2022-26936 - Windows Server Service Information Disclosure Vulnerability
CVE-2022-26937 - Windows Network File System Remote Code Execution Vulnerability
CVE-2022-26938 - Storage Spaces Direct Elevation of Privilege Vulnerability
CVE-2022-26939 - Storage Spaces Direct Elevation of Privilege Vulnerability
CVE-2022-26940 - Remote Desktop Protocol Client Information Disclosure Vulnerability
CVE-2022-22011 - Windows Graphics Component Information Disclosure Vulnerability
CVE-2022-22012 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-22013 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-22014 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-22015 - Windows Remote Desktop Protocol (RDP) Information Disclosure Vulnerability
CVE-2022-22016 - Windows PlayToManager Elevation of Privilege Vulnerability
CVE-2022-22017 - Remote Desktop Client Remote Code Execution Vulnerability
CVE-2022-29102 - Windows Failover Cluster Information Disclosure Vulnerability
CVE-2022-29103 - Windows Remote Access Connection Manager Elevation of Privilege Vulnerability
CVE-2022-29104 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-29105 - Microsoft Windows Media Foundation Remote Code Execution Vulnerability
CVE-2022-29106 - Windows Hyper-V Shared Virtual Disk Elevation of Privilege Vulnerability
CVE-2022-29112 - Windows Graphics Component Information Disclosure Vulnerability
CVE-2022-29113 - Windows Digital Media Receiver Elevation of Privilege Vulnerability
CVE-2022-29114 - Windows Print Spooler Information Disclosure Vulnerability
CVE-2022-29115 - Windows Fax Service Remote Code Execution Vulnerability
CVE-2022-29117 - .NET and Visual Studio Denial of Service Vulnerability
CVE-2022-29125 - Windows Push Notifications Apps Elevation of Privilege Vulnerability
CVE-2022-29126 - Tablet Windows User Interface Application Core Elevation of Privilege Vulnerability
CVE-2022-29127 - BitLocker Security Feature Bypass Vulnerability
CVE-2022-29128 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-29129 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-29130 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-29131 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-29132 - Windows Print Spooler Elevation of Privilege Vulnerability
CVE-2022-29133 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2022-29134 - Windows Clustered Shared Volume Information Disclosure Vulnerability
CVE-2022-29135 - Windows Cluster Shared Volume (CSV) Elevation of Privilege Vulnerability
CVE-2022-29137 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-29138 - Windows Clustered Shared Volume Elevation of Privilege Vulnerability
CVE-2022-29139 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-29140 - Windows Print Spooler Information Disclosure Vulnerability
CVE-2022-29141 - Windows LDAP Remote Code Execution Vulnerability
CVE-2022-29142 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2022-29145 - .NET and Visual Studio Denial of Service Vulnerability
CVE-2022-29148 - Visual Studio Remote Code Execution Vulnerability

CVE-2022-22019 - Remote Procedure Call Runtime Remote Code Execution Vulnerability
CVE-2022-29972 - Insight Software: CVE-2022-29972 Magnitude Simba Amazon Redshift ODBC Driver
CVE-2022-23279 - Windows ALPC Elevation of Privilege Vulnerability
CVE-2022-26923 - Active Directory Domain Services Elevation of Privilege Vulnerability
CVE-2022-29116 - Windows Kernel Information Disclosure Vulnerability
CVE-2022-29120 - Windows Clustered Shared Volume Information Disclosure Vulnerability
CVE-2022-29121 - Windows WLAN AutoConfig Service Denial of Service Vulnerability
CVE-2022-29122 - Windows Clustered Shared Volume Information Disclosure Vulnerability
CVE-2022-29123 - Windows Clustered Shared Volume Information Disclosure Vulnerability
CVE-2022-29150 - Windows Cluster Shared Volume (CSV) Elevation of Privilege Vulnerability
CVE-2022-29151 - Windows Cluster Shared Volume (CSV) Elevation of Privilege Vulnerability
ADV220001 - Upcoming improvements to Azure Data Factory and Azure Synapse Pipeline infrastructure in response to CVE-2022-29972
CVE-2022-30129 - Visual Studio Code Remote Code Execution Vulnerability

Affected Products:
Windows Server 2012
Windows Server 2022
Windows 11 for x64-based Systems
Windows 10 Version 20H2 for x64-based Systems
Microsoft Visual Studio 2022 version 17.1
Microsoft Visual Studio 2019 version 16.9 (includes 16.0 - 16.8)
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows 10 Version 1809 for ARM64-based Systems
Windows 10 Version 1607 for 32-bit Systems
Windows Server 2016 (Server Core installation)
Azure Synapse
Azure Data Factory
Windows 10 Version 21H2 for 32-bit Systems
Windows 10 Version 21H1 for ARM64-based Systems
Windows Server 2019 (Server Core installation)
Windows Server 2019
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft Visual Studio 2017 version 15.9 (includes 15.0 - 15.8)
Windows 10 Version 20H2 for ARM64-based Systems
Microsoft Visual Studio 2022 version 17.0
Windows 11 for ARM64-based Systems
Windows 7 for 32-bit Systems Service Pack 1
Windows 10 Version 1809 for x64-based Systems
Windows 10 Version 1909 for ARM64-based Systems
Windows Server 2012 (Server Core installation)
Windows 10 Version 1909 for 32-bit Systems
Windows 10 Version 21H2 for ARM64-based Systems
Windows 10 for x64-based Systems
.NET Core 3.1
Visual Studio Code
.NET 5.0
Windows 10 for 32-bit Systems
Windows Server 2016

.NET 6.0
Windows 8.1 for x64-based systems
Windows 10 Version 21H1 for x64-based Systems
Microsoft Visual Studio 2019 version 16.11 (includes 16.0 - 16.10)
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server, version 20H2 (Server Core Installation)
Windows 10 Version 20H2 for 32-bit Systems
Windows 10 Version 21H2 for x64-based Systems
Windows 10 Version 1809 for 32-bit Systems
Remote Desktop client for Windows Desktop
Windows 8.1 for 32-bit systems
Windows 7 for x64-based Systems Service Pack 1
Windows Server 2012 R2
Windows 10 Version 1909 for x64-based Systems
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows RT 8.1
Windows Server 2012 R2 (Server Core installation)
Windows Server 2008 for x64-based Systems Service Pack 2
Self-hosted Integration Runtime
Windows Server 2022 (Server Core installation)
Windows 10 Version 21H1 for 32-bit Systems
Windows 10 Version 1607 for x64-based Systems

CVSS Base Score: 9.8

OpenSSH 'kbdint_next_device' Function Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The kbdint_next_device function in auth2-chall.c in sshd in OpenSSH through 6.9 does not properly restrict the processing of keyboard-interactive devices within a single connection, which makes it easier for remote attackers to conduct brute-force attacks or cause a denial of service (CPU consumption) via a long and duplicative list in the ssh -oKbdInteractiveDevices option, as demonstrated by a modified client that provides a different password for each pam element on this list.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH Security Bypass Vulnerability High

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

Vulnerability Details

The shared memory manager (associated with pre-authentication compression) in sshd in OpenSSH before 7.4 does not ensure that a bounds check is enforced by all compilers, which might allows local users to gain privileges by leveraging access to a sandboxed privilege-separation process, related to the m_zback and m_zlib data structures.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH 'session.c' Local Security Bypass Vulnerability — High

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

Vulnerability Details

The do_setup_env function in session.c in sshd in OpenSSH through 7.2p2, when the UseLogin feature is enabled and PAM is configured to read .pam_environment files in user home directories, allows local users to gain privileges by triggering a crafted environment for the /bin/login program, as demonstrated by an LD_PRELOAD environment variable.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH 'ssh-agent.c' Untrusted Search Path Vulnerability High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Untrusted search path vulnerability in ssh-agent.c in ssh-agent in OpenSSH before 7.4 allows remote attackers to execute arbitrary local PKCS#11 modules by leveraging control over a forwarded agent-socket.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH 'ssh-agent' Double Free Vulnerability High

Solution Details

Use of rsync in the place of scp for better security. If scp is required, please ensure it is updated with the latest patches and fixes from the vendor.

Vulnerability Details

ssh-agent in OpenSSH has a double free that may be relevant in a few less-common scenarios, such as unconstrained agent-socket access on a legacy operating system, or the forwarding of an agent to an attacker-controlled host.
Impact:
An attacker could leverage this vulnerability to cause a program's memory management data structures to become corrupted and could allow a malicious user to write values in arbitrary memory spaces.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.6

OpenSSH 'ssh/kex.c' Denial of Service Vulnerability

High

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

Vulnerability Details

The kex_input_kexinit function in kex.c in OpenSSH 6.x and 7.x through 7.3 allows remote attackers to cause a denial of service (memory consumption) by sending many duplicate KEXINIT requests.

CVSS Base Score: 7.5

OpenSSH X11 Forwarding Access Bypass — High

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The client in OpenSSH before 7.2 mishandles failed cookie generation for untrusted X11 forwarding and relies on the local X11 server for access-control decisions, which allows remote X11 clients to trigger a fallback and obtain trusted X11 forwarding privileges by leveraging configuration issues on this X11 server, as demonstrated by lack of the SECURITY extension on this X11 server.

CVSS Base Score: 7.5

PHP bcmath.c 'bcpowmod' Modified Data Structure Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The bcpowmod function in ext/bcmath/bcmath.c in PHP before 5.5.35, 5.6.x before 5.6.21, and 7.x before 7.0.6 modifies certain data structures without considering whether they are copies of the _zero_, _one_, or _two_ global variable, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via a crafted call.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP bcmath.c 'bcpowmod' Negative Integer Denial of Service High

Vulnerability Details

The bcpowmod function in ext/bcmath/bcmath.c in PHP before 5.5.35, 5.6.x before 5.6.21, and 7.x before 7.0.6 accepts a negative integer for the scale argument, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via a crafted call.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

PHP before 5.5.36, 5.6.x before 5.6.22, and 7.x before 7.0.7 'get_icu_value_internal' Function Denial of Service

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The get_icu_value_internal function in ext/intl/locale/locale_methods.c in PHP before 5.5.36, 5.6.x before 5.6.22, and 7.x before 7.0.7 does not ensure the presence of a '\0' character, which allows remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact via a crafted locale_get_primary_language call.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

CVSS Vector: AV:N/AC:L/Au:N/C:P/I:P/A:P

PHP before 5.5.36 and 5.6.x before 5.6.22 'file.c' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Integer overflow in the fread function in ext/standard/file.c in PHP before 5.5.36 and 5.6.x before 5.6.22 allows remote attackers to cause a denial of service or possibly have unspecified other impact via a large integer in the second argument.

CVSS Base Score: 7.5

CVSS Vector: AV:N/AC:L/Au:N/C:P/I:P/A:P

PHP before 5.5.36 and 5.6.x before 5.6.22 'php_escape_html_entities_ex' Function Denial of Service

High

Vulnerability Details

Integer overflow in the php_escape_html_entities_ex function in ext/standard/html.c in PHP before 5.5.36 and 5.6.x before 5.6.22 allows remote attackers to cause a denial of service or possibly have unspecified other impact by triggering a large output string from a FILTER_SANITIZE_FULL_SPECIAL_CHARS filter_var call. NOTE: this vulnerability exists because of an incomplete fix for CVE-2016-5094.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

PHP CGI Component Command Execution Vulnerability

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

sapi/cgi/cgi_main.c in the CGI component in PHP through 5.4.36, 5.5.x through 5.5.20, and 5.6.x through 5.6.4, when mmap is used to read a .php file, does not properly consider the mapping's length during processing of an invalid file that begins with a # character and lacks a newline character, which causes an out-of-bounds read and might (1) allow remote attackers to obtain sensitive information from php-cgi process memory by leveraging the ability to upload a .php file or (2) trigger unexpected code execution if a valid PHP script is present in memory locations adjacent to the mapping.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'curl_file.c' CURLFile Implementation Denial of Service

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Use-after-free vulnerability in the CURLFile implementation in ext/curl/curl_file.c in PHP before 5.6.27 and 7.x before 7.0.12 allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data that is mishandled during __wakeup processing.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'dynamicGetbuf' Denial of Service Vulnerability

High

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

Integer signedness error in the dynamicGetbuf function in gd_io_dp.c in the GD Graphics Library (aka libgd) through 2.2.3, as used in PHP before 5.6.28 and 7.x before 7.0.13, allows remote attackers to cause a denial of service (stack-based buffer overflow) or possibly have unspecified other impact via a crafted imagecreatefromstring call.
Impact:
An attacker can exploit this issue to create a denial-of-service condition. Due to the nature of this issue, arbitrary code execution may be possible but this has not been confirmed.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'escapeshellarg' Function Remote Command Execution Vulnerability — High

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The escapeshellarg function in ext/standard/exec.c in PHP before 5.4.42, 5.5.x before 5.5.26, and 5.6.x before 5.6.10 on Windows allows remote attackers to execute arbitrary OS commands via a crafted string to an application that accepts command-line arguments for a call to the PHP system function.

PHP exif.c 'exif_process_IFD_in_JPEG' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exif_process_IFD_in_JPEG function in ext/exif/exif.c in PHP before 5.5.35, 5.6.x before 5.6.21, and 7.x before 7.0.6 does not validate IFD sizes, which allows remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact via crafted header data.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP exif.c 'exif_process_IFD_TAG' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exif_process_IFD_TAG function in ext/exif/exif.c in PHP before 5.5.35, 5.6.x before 5.6.21, and 7.x before 7.0.6 does not properly construct spprintf arguments, which allows remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact via crafted header data.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP exif.c 'exif_process_TIFF_in_JPEG' Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exif_process_TIFF_in_JPEG function in ext/exif/exif.c in PHP before 5.5.35, 5.6.x before 5.6.21, and 7.x before 7.0.6 does not validate TIFF start data, which allows remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact via crafted header data.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'exif_process_IFD_in_MAKERNOTE' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exif_process_IFD_in_MAKERNOTE function in ext/exif/exif.c in PHP before 5.5.38, 5.6.x before 5.6.24, and 7.x before 7.0.9 allows remote attackers to cause a denial of service (out-of-bounds array access and memory corruption), obtain sensitive information from process memory, or possibly have unspecified other impact via a crafted JPEG image.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'exif_process_IFD_in_TIFF' Uninitialized Read Vulnerability High

Vulnerability Details

An issue was discovered in the EXIF component in PHP before 7.1.27, 7.2.x before 7.2.16, and 7.3.x before 7.3.3. There is an uninitialized read in exif_process_IFD_in_TIFF.
Impact:
An attacker could leverage this vulnerability to read the contents of memory to obtain information that could aid in launching further attacks.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of PHP.

PHP 'ext/phar/phar_object.c' Zero-length Uncompress Denial of Service

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/phar/phar_object.c in PHP before 5.5.32, 5.6.x before 5.6.18, and 7.x before 7.0.3 mishandles zero-length uncompressed data, which allows remote attackers to cause a denial of service (heap memory corruption) or possibly have unspecified other impact via a crafted (1) TAR, (2) ZIP, or (3) PHAR archive.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'ext/soap/soap.c' Type Confusion Vulnerability — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The SoapClient::__call method in ext/soap/soap.c in PHP before 5.4.39, 5.5.x before 5.5.23, and 5.6.x before 5.6.7 does not verify that __default_headers is an array, which allows remote attackers to execute arbitrary code by providing crafted serialized data with an unexpected data type, related to a "type confusion" issue.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

PHP 'ext/spl/spl_array.c' Use-after-free Remote Code Execution — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Use-after-free vulnerability in the SPL unserialize implementation in ext/spl/spl_array.c in PHP before 5.4.44, 5.5.x before 5.5.28, and 5.6.x before 5.6.12 allows remote attackers to execute arbitrary code via crafted serialized data that triggers misuse of an array field.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

CVSS Vector: AV:N/AC:L/Au:N/C:P/I:P/A:P

PHP ext/standard/http_fopen_wrapper.c 'php_stream_url_wrap_http_ex' Stack-based Buffer Under-read — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

In PHP through 5.6.33, 7.0.x before 7.0.28, 7.1.x through 7.1.14, and 7.2.x through 7.2.2, there is a stack-based buffer under-read while parsing an HTTP response in the php_stream_url_wrap_http_ex function in ext/standard/http_fopen_wrapper.c. This subsequently results in copying a large string.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP File Extension Restriction Bypass

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

PHP before 5.4.41, 5.5.x before 5.5.25, and 5.6.x before 5.6.9 truncates a pathname upon encountering a \x00 character in certain situations, which allows remote attackers to bypass intended extension restrictions and access files or directories with unexpected names via a crafted argument to (1) set_include_path, (2) tempnam, (3) rmdir, or (4) readlink. NOTE: this vulnerability exists because of an incomplete fix for CVE-2006-7243.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

PHP Fileinfo Component 'apprentice_load' Denial of Service Flaw — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

** DISPUTED ** The apprentice_load function in libmagic/apprentice.c in the Fileinfo component in PHP through 5.6.4 attempts to perform a free operation on a stack-based character array, which allows remote attackers to cause a denial of service (memory corruption or application crash) or possibly have unspecified other impact via unknown vectors. NOTE: this is disputed by the vendor because the standard erealloc behavior makes the free operation unreachable.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Fileinfo Component Crafted ELF File Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

readelf.c in file before 5.22, as used in the Fileinfo component in PHP before 5.4.37, 5.5.x before 5.5.21, and 5.6.x before 5.6.5, does not consider that pread calls sometimes read only a subset of the available data, which allows remote attackers to cause a denial of service (uninitialized memory access) or possibly have unspecified other impact via a crafted ELF file.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'ftp_genlist' Function Heap Buffer Overflow — High

Vulnerability Details

Integer overflow in the ftp_genlist function in ext/ftp/ftp.c in PHP before 5.4.41, 5.5.x before 5.5.25, and 5.6.x before 5.6.9 allows remote FTP servers to execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

PHP gd.c 'imagegammacorrect' Input Validation Denial of Service Vulnerability

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The imagegammacorrect function in ext/gd/gd.c in PHP before 5.6.25 and 7.x before 7.0.10 does not properly validate gamma values, which allows remote attackers to cause a denial of service (out-of-bounds write) or possibly have unspecified other impact by providing different signs for the second and third arguments.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'gd_webp.c' Denial of Service Vulnerability High

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

Integer overflow in the gdImageWebpCtx function in gd_webp.c in the GD Graphics Library (aka libgd) through 2.2.3, as used in PHP through 7.0.11, allows remote attackers to cause a denial of service (heap-based buffer overflow) or possibly have unspecified other impact via crafted imagewebp and imagedestroy calls.
Impact:
An attacker could cause a denial of service condition on the asset.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Heap-Based Buffer Over-Read Vulnerability — High

Vulnerability Details

An issue was discovered in PHP before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14, and 7.3.x before 7.3.1. A heap-based buffer over-read in PHAR reading functions in the PHAR extension may allow an attacker to read allocated or unallocated memory past the actual data when trying to parse the file name, a different vulnerability than CVE-2018-20783. This is related to phar_detect_phar_fname_ext in ext/phar/phar.c.
Impact:
Successfully exploiting these issues allow attackers to execute arbitrary code in the affected asset or obtain sensitive information. Failed exploits will result in denial-of-service conditions.

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of PHP.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP IMAP PHP Extension 'phar_fix_filepath' Function Buffer Overflow Vulnerability

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Stack-based buffer overflow in the phar_fix_filepath function in ext/phar/phar.c in PHP before 5.4.43, 5.5.x before 5.5.27, and 5.6.x before 5.6.11 allows remote attackers to cause a denial of service or possibly have unspecified other impact via a large length value, as demonstrated by mishandling of an e-mail attachment by the imap PHP extension.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

PHP 'incomplete_class.c' Type Confusion Denial of Service — High

Vulnerability Details

The __PHP_Incomplete_Class function in ext/standard/incomplete_class.c in PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 allows remote attackers to cause a denial of service (application crash) or possibly execute arbitrary code via an unexpected data type, related to a "type confusion" issue.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

PHP Invalid Memory Access Vulnerability High

Vulnerability Details

An issue was discovered in PHP before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14, and 7.3.x before 7.3.1. Invalid input to the function xmlrpc_decode() can lead to an invalid memory access (heap out of bounds read or read after free). This is related to xml_elem_parse_buf in ext/xmlrpc/libxmlrpc/xml_element.c.
Impact:
Successfully exploiting these issues allow attackers to execute arbitrary code in the affected asset or obtain sensitive information. Failed exploits will result in denial-of-service conditions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'locale_accept_from_http' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The locale_accept_from_http function in ext/intl/locale/locale_methods.c in PHP before 5.5.38, 5.6.x before 5.6.24, and 7.x before 7.0.9 does not properly restrict calls to the ICU uloc_acceptLanguageFromHTTP function, which allows remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact via a call with a long argument.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'locale_methods.c' Argument Overflow Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The get_icu_disp_value_src_php function in ext/intl/locale/locale_methods.c in PHP before 5.3.29, 5.4.x before 5.4.30, and 5.5.x before 5.5.14 does not properly restrict calls to the ICU uresbund.cpp component, which allows remote attackers to cause a denial of service (buffer overflow) or possibly have unspecified other impact via a locale_get_display_name call with a long first argument.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP mcrypt.c Multiple Integer Overflow Vulnerabilities — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Multiple integer overflows in mcrypt.c in the mcrypt extension in PHP before 5.5.37, 5.6.x before 5.6.23, and 7.x before 7.0.8 allow remote attackers to cause a denial of service (heap-based buffer overflow and application crash) or possibly have unspecified other impact via a crafted length value, related to the (1) mcrypt_generic and (2) mdecrypt_generic functions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Multiple Heap-Based Buffer Over-Read Vulnerabilities — High

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of PHP.

Vulnerability Details

An issue was discovered in PHP before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14, and 7.3.x before 7.3.1. A number of heap-based buffer over-read instances are present in mbstring regular expression functions when supplied with invalid multibyte data. These occur in ext/mbstring/oniguruma/regcomp.c, ext/mbstring/oniguruma/regexec.c, ext/mbstring/oniguruma/regparse.c, ext/mbstring/oniguruma/enc/unicode.c, and ext/mbstring/oniguruma/src/utf32_be.c when a multibyte regular expression pattern contains invalid multibyte sequences.
Impact:
Successfully exploiting these issues allow attackers to execute arbitrary code in the affected asset or obtain sensitive information. Failed exploits will result in denial-of-service conditions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Multiple Type Confusion Denial of Service Vulnerabilities — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

PHP before 5.6.7 might allow remote attackers to cause a denial of service (application crash) or possibly execute arbitrary code via an unexpected data type, related to "type confusion" issues in (1) ext/soap/php_encoding.c, (2) ext/soap/php_http.c, and (3) ext/soap/soap.c, a different issue than CVE-2015-4600.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Pathname Sanitization Remote Arbitrary File Access Vulnerability — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

PHP before 5.4.42, 5.5.x before 5.5.26, and 5.6.x before 5.6.10 does not ensure that pathnames lack %00 sequences, which might allow remote attackers to read or write to arbitrary files via crafted input to an application that calls (1) a DOMDocument save method or (2) the GD imagepsloadfont function, as demonstrated by a filename\0.html attack that bypasses an intended configuration in which client users may write to only .html files.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'pcntl_exec' Implementation File Extension Restriction Bypass — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The pcntl_exec implementation in PHP before 5.4.41, 5.5.x before 5.5.25, and 5.6.x before 5.6.9 truncates a pathname upon encountering a \x00 character, which might allow remote attackers to bypass intended extension restrictions and execute files with unexpected names via a crafted first argument. NOTE: this vulnerability exists because of an incomplete fix for CVE-2006-7243.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP phar_object.c 'phar_convert_to_other' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The phar_convert_to_other function in ext/phar/phar_object.c in PHP before 5.4.43, 5.5.x before 5.5.27, and 5.6.x before 5.6.11 does not validate a file pointer before a close operation, which allows remote attackers to cause a denial of service (segmentation fault) or possibly have unspecified other impact via a crafted TAR archive that is mishandled in a Phar::convertToData call.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'phar_set_inode' Function Stack Buffer Overflow — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Multiple stack-based buffer overflows in the phar_set_inode function in phar_internal.h in PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 allow remote attackers to execute arbitrary code via a crafted length value in a (1) tar, (2) phar, or (3) ZIP archive.

CVSS Base Score: 7.5

CVSS Vector: AV:N/AC:L/Au:N/C:P/I:P/A:P

PHP 'php_date.c' Multiple Use-After-Free Arbitrary Code Execution Flaws

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Multiple use-after-free vulnerabilities in ext/date/php_date.c in PHP before 5.4.38, 5.5.x before 5.5.22, and 5.6.x before 5.6.6 allow remote attackers to execute arbitrary code via crafted serialized input containing a (1) R or (2) r type specifier in (a) DateTimeZone data handled by the php_date_timezone_initialize_from_hash function or (b) DateTime data handled by the php_date_initialize_from_hash function.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP php_http.c 'make_http_soap_request' Remote Code Execution High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The make_http_soap_request function in ext/soap/php_http.c in PHP before 5.4.44, 5.5.x before 5.5.28, and 5.6.x before 5.6.12 does not properly retrieve keys, which allows remote attackers to cause a denial of service (NULL pointer dereference, type confusion, and application crash) or possibly execute arbitrary code via crafted serialized data representing a numerically indexed _cookies array, related to the SoapClient::__call method in ext/soap/soap.c.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP php_mbregex.c '_php_mb_regex_ereg_replace_exec' Double Free Vulnerability

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Double free vulnerability in the _php_mb_regex_ereg_replace_exec function in php_mbregex.c in the mbstring extension in PHP before 5.5.37, 5.6.x before 5.6.23, and 7.x before 7.0.8 allows remote attackers to execute arbitrary code or cause a denial of service (application crash) by leveraging a callback exception.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'php_snmp_error' Function Format String Arbitrary Code Execution

High

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Format string vulnerability in the php_snmp_error function in ext/snmp/snmp.c in PHP before 5.5.34, 5.6.x before 5.6.20, and 7.x before 7.0.5 allows remote attackers to execute arbitrary code via format string specifiers in an SNMP::get call.

CVSS Base Score: 7.5

PHP 'php_url_parse_ex' Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The php_url_parse_ex function in ext/standard/url.c in PHP before 5.5.38 allows remote attackers to cause a denial of service (buffer over-read) or possibly have unspecified other impact via vectors involving the smart_str data type.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP php_zip.c 'getFromIndex', 'getFromName' Heap Overflow — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Multiple integer overflows in php_zip.c in the zip extension in PHP before 7.0.6 allow remote attackers to cause a denial of service (heap-based buffer overflow and application crash) or possibly have unspecified other impact via a crafted call to (1) getFromIndex or (2) getFromName in the ZipArchive class.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP php_zip.c Zip Extension Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

php_zip.c in the zip extension in PHP before 5.5.37, 5.6.x before 5.6.23, and 7.x before 7.0.8 improperly interacts with the unserialize implementation and garbage collection, which allows remote attackers to execute arbitrary code or cause a denial of service (use-after-free and application crash) via crafted serialized data containing a ZipArchive object.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

PHP 'process_nested_data' Function Use-After-Free Flaw High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Use-after-free vulnerability in the process_nested_data function in ext/standard/var_unserializer.re in PHP before 5.4.37, 5.5.x before 5.5.21, and 5.6.x before 5.6.5 allows remote attackers to execute arbitrary code via a crafted unserialize call that leverages improper handling of duplicate numerical keys within the serialized properties of an object. NOTE: this vulnerability exists because of an incomplete fix for CVE-2014-8142.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'process_nested_data' Function Use-After-Free Remote Code Execution Flaw

High

Vulnerability Details

Use-after-free vulnerability in the process_nested_data function in ext/standard/var_unserializer.re in PHP before 5.4.39, 5.5.x before 5.5.23, and 5.6.x before 5.6.7 allows remote attackers to execute arbitrary code via a crafted unserialize call that leverages use of the unset function within an __wakeup function, a related issue to CVE-2015-0231.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

PHP sanitizing.c 'php_filter_encode' Integer Overflow Denial of Service

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Integer overflow in the php_filter_encode_url function in ext/filter/sanitizing_filters.c in PHP before 7.0.4 allows remote attackers to cause a denial of service or possibly have unspecified other impact via a long string, leading to a heap-based buffer overflow.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'sapi/fpm/fpm/fpm_unix.c' Privilege Escalation Vulnerability — High

Vulnerability Details

sapi/fpm/fpm/fpm_unix.c in the FastCGI Process Manager (FPM) in PHP before 5.4.28 and 5.5.x before 5.5.12 uses 0666 permissions for the UNIX socket, which allows local users to gain privileges via a crafted FastCGI client.
Impact:
An attacker could gain escalated privileges on the target system.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

PHP 'Serializable Interface, SplObjectStorage class, SplDoublyLinkedList class' Multiple Use-after-free Remote Code Execution — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Multiple use-after-free vulnerabilities in PHP before 5.4.45, 5.5.x before 5.5.29, and 5.6.x before 5.6.13 allow remote attackers to execute arbitrary code via vectors related to (1) the Serializable interface, (2) the SplObjectStorage class, and (3) the SplDoublyLinkedList class, which are mishandled during unserialization.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'session.c' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/session/session.c in PHP before 5.5.38, 5.6.x before 5.6.24, and 7.x before 7.0.9 does not properly maintain a certain hash data structure, which allows remote attackers to cause a denial of service (use-after-free) or possibly have unspecified other impact via vectors related to session deserialization.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Session Deserializer 'php_var_unserialize' Remote Code Execution

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The session deserializer in PHP before 5.4.45, 5.5.x before 5.5.29, and 5.6.x before 5.6.13 mishandles multiple php_var_unserialize calls, which allow remote attackers to execute arbitrary code or cause a denial of service (use-after-free) via crafted session content.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'simplestring_addn' Denial of Service Vulnerability High

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

Integer signedness error in the simplestring_addn function in simplestring.c in xmlrpc-epi through 0.54.2, as used in PHP before 5.5.38, 5.6.x before 5.6.24, and 7.x before 7.0.9, allows remote attackers to cause a denial of service (heap-based buffer overflow) or possibly have unspecified other impact via a long first argument to the PHP xmlrpc_encode_request function.
Impact:
An attacker could cause a denial of service condition on the asset.

CVSS Base Score: 7.5

PHP soap.c 'SoapClient__call' Arbitrary Code Execution — High

Vulnerability Details

The SoapClient __call method in ext/soap/soap.c in PHP before 5.4.45, 5.5.x before 5.5.29, and 5.6.x before 5.6.13 does not properly manage headers, which allows remote attackers to execute arbitrary code via crafted serialized data that triggers a "type confusion" in the serialize_function_call function.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

CVSS Base Score: 7.5

PHP 'soap.c' Type Confusion Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The SoapFault::__toString method in ext/soap/soap.c in PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 allows remote attackers to obtain sensitive information, cause a denial of service (application crash), or possibly execute arbitrary code via an unexpected data type, related to a "type confusion" issue.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP spl_array.c SplArray Unserialization Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/spl/spl_array.c in PHP before 5.6.26 and 7.x before 7.0.11 proceeds with SplArray unserialization without validating a return value and data type, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP spl_array.c 'SPL Extension' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

spl_array.c in the SPL extension in PHP before 5.5.37 and 5.6.x before 5.6.23 improperly interacts with the unserialize implementation and garbage collection, which allows remote attackers to execute arbitrary code or cause a denial of service (use-after-free and application crash) via crafted serialized data.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP SPL 'ArrayObject, SplObjectStorage, SplDoublyLinkedList' Multiple Use-after-free Remote Code Execution

High

Vulnerability Details

Multiple use-after-free vulnerabilities in SPL in PHP before 5.4.44, 5.5.x before 5.5.28, and 5.6.x before 5.6.12 allow remote attackers to execute arbitrary code via vectors involving (1) ArrayObject, (2) SplObjectStorage, and (3) SplDoublyLinkedList, which are mishandled during unserialization.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

PHP SPL Component Type Confusion Vulnerability High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The SPL component in PHP before 5.4.30 and 5.5.x before 5.5.14 incorrectly anticipates that certain data structures will have the array data type after unserialization, which allows remote attackers to execute arbitrary code via a crafted string that triggers use of a Hashtable destructor, related to "type confusion" issues in (1) ArrayObject and (2) SPLObjectStorage.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP spl_directory.c 'SplFileObject::fread' Denial of Service — High

Vulnerability Details

Integer overflow in the SplFileObject::fread function in spl_directory.c in the SPL extension in PHP before 5.5.37 and 5.6.x before 5.6.23 allows remote attackers to cause a denial of service or possibly have unspecified other impact via a large integer argument, a related issue to CVE-2016-5096.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP spl_observer.c SplObjectStorage Unserialize Implementation Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The SplObjectStorage unserialize implementation in ext/spl/spl_observer.c in PHP before 7.0.12 does not verify that a key is an object, which allows remote attackers to execute arbitrary code or cause a denial of service (uninitialized memory access) via crafted serialized data.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'spl_ptr_heap_insert' Function Arbitrary Code Execution Vulnerability

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Use-after-free vulnerability in the spl_ptr_heap_insert function in ext/spl/spl_heap.c in PHP before 5.5.27 and 5.6.x before 5.6.11 allows remote attackers to execute arbitrary code by triggering a failed SplMinHeap::compare operation.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'tar.c' Stack Buffer Overflow — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Stack-based buffer overflow in ext/phar/tar.c in PHP before 5.5.32, 5.6.x before 5.6.18, and 7.x before 7.0.3 allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact via a crafted TAR archive.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'uncompressed_filesize' Crafted PHAR Archive Denial of Service Vulnerability

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The ZIP signature-verification feature in PHP before 5.6.26 and 7.x before 7.0.11 does not ensure that the uncompressed_filesize field is large enough, which allows remote attackers to cause a denial of service (out-of-bounds memory access) or possibly have unspecified other impact via a crafted PHAR archive, related to ext/phar/util.c and ext/phar/zip.c.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'var_unserializer.c' Integer Overflow — High

Vulnerability Details

Integer overflow in the object_custom function in ext/standard/var_unserializer.c in PHP before 5.4.34, 5.5.x before 5.5.18, and 5.6.x before 5.6.2 allows remote attackers to cause a denial of service (application crash) or possibly execute arbitrary code via an argument to the unserialize function that triggers calculation of a large length value.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

PHP var_unserializer.c Invalid Object Denial of Service Vulnerability High

Vulnerability Details

ext/standard/var_unserializer.c in PHP before 5.6.25 and 7.x before 7.0.10 mishandles certain invalid objects, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data that leads to a (1) __destruct call or (2) magic method call.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP var_unserializer.re 'finish_nested_data' Buffer Overlow High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The finish_nested_data function in ext/standard/var_unserializer.re in PHP before 5.6.31, 7.0.x before 7.0.21, and 7.1.x before 7.1.7 is prone to a buffer over-read while unserializing untrusted data. Exploitation of this issue can have an unspecified impact on the integrity of PHP.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP var_unserializer.re Object Deserialization Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/standard/var_unserializer.re in PHP before 5.6.26 mishandles object-deserialization failures, which allows remote attackers to cause a denial of service (memory corruption) or possibly have unspecified other impact via an unserialize call that references a partially constructed object.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'var_unserializer.re' Use-after-free Vulnerability — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Use-after-free vulnerability in the process_nested_data function in ext/standard/var_unserializer.re in PHP before 5.4.36, 5.5.x before 5.5.20, and 5.6.x before 5.6.4 allows remote attackers to execute arbitrary code via a crafted unserialize call that leverages improper handling of duplicate keys within the serialized properties of an object, a different vulnerability than CVE-2004-1019.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Wakeup Processing Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

PHP through 5.6.27 and 7.x through 7.0.12 mishandles property modification during __wakeup processing, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data, as demonstrated by Exception::__toString with DateInterval::__wakeup.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP wddx.c 'php_wddx_process_data' Denial of Service Vulnerability High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The php_wddx_process_data function in ext/wddx/wddx.c in PHP before 5.6.25 and 7.x before 7.0.10 allows remote attackers to cause a denial of service (segmentation fault) or possibly have unspecified other impact via an invalid ISO 8601 time value, as demonstrated by a wddx_deserialize call that mishandles a dateTime element in a wddxPacket XML document.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP wddx.c 'wddx_stack_destroy' Denial of Service Vulnerability High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Use-after-free vulnerability in the wddx_stack_destroy function in ext/wddx/wddx.c in PHP before 5.6.26 and 7.x before 7.0.11 allows remote attackers to cause a denial of service or possibly have unspecified other impact via a wddxPacket XML document that lacks an end-tag for a recordset field element, leading to mishandling in a wddx_deserialize call.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'wddx.c' XML Document Denial of Service High

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The php_wddx_push_element function in ext/wddx/wddx.c in PHP before 5.6.29 and 7.x before 7.0.14 allows remote attackers to cause a denial of service (out-of-bounds read and memory corruption) or possibly have unspecified other impact via an empty boolean element in a wddxPacket XML document.

CVSS Base Score: 7.5

CVSS Vector: AV:N/AC:L/Au:N/C:P/I:P/A:P

PHP WDDX Extension Use-after-free Vulnerability

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Use-after-free vulnerability in wddx.c in the WDDX extension in PHP before 5.5.33 and 5.6.x before 5.6.19 allows remote attackers to cause a denial of service (memory corruption and application crash) or possibly have unspecified other impact by triggering a wddx_deserialize call on XML data containing a crafted var element.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP xml.c 'xml_parse_into_struct' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The xml_parse_into_struct function in ext/xml/xml.c in PHP before 5.5.35, 5.6.x before 5.6.21, and 7.x before 7.0.6 allows remote attackers to cause a denial of service (buffer under-read and segmentation fault) or possibly have unspecified other impact via crafted XML data in the second argument, leading to a parser level of zero.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'zend_exceptions.c' Type Confusion Remote Code Execution — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exception::getTraceAsString function in Zend/zend_exceptions.c in PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 allows remote attackers to execute arbitrary code via an unexpected data type, related to a "type confusion" issue.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP zend_string_extend in 'Zend/zend_string.h' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The zend_string_extend function in Zend/zend_string.h in PHP through 7.1.5 does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP ZIP Extension "_zip_cdir_new" Function Integer Overflow High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Integer overflow in the _zip_cdir_new function in zip_dirent.c in libzip 0.11.2 and earlier, as used in the ZIP extension in PHP before 5.4.39, 5.5.x before 5.5.23, and 5.6.x before 5.6.7 and other products, allows remote attackers to cause a denial of service (application crash) or possibly execute arbitrary code via a ZIP archive that contains many entries, leading to a heap-based buffer overflow.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Ruby 'Oniguruma-mod' and PHP fetch_token in 'mbstring' Denial of Service

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

An issue was discovered in Oniguruma 6.2.0, as used in Oniguruma-mod in Ruby through 2.4.1 and mbstring in PHP through 7.1.5. A heap out-of-bounds write or read occurs in next_state_val() during regular expression compilation. Octal numbers larger than 0xff are not handled correctly in fetch_token() and fetch_token_in_cc(). A malformed regular expression containing an octal number in the form of '\700' would produce an invalid code point value larger than 0xff in next_state_val(), resulting in an out-of-bounds write memory corruption.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Ruby 'Oniguruma-mod' and PHP 'mbstring' Denial of Service High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

An issue was discovered in Oniguruma 6.2.0, as used in Oniguruma-mod in Ruby through 2.4.1 and mbstring in PHP through 7.1.5. A stack out-of-bounds read occurs in match_at() during regular expression searching. A logical error involving order of validation and access in match_at() could result in an out-of-bounds read from a stack buffer.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Ruby 'Oniguruma-mod' and PHP 'mbstring' forward_search_range Denial of Service — High

Vulnerability Details

An issue was discovered in Oniguruma 6.2.0, as used in Oniguruma-mod in Ruby through 2.4.1 and mbstring in PHP through 7.1.5. A stack out-of-bounds read occurs in mbc_enc_len() during regular expression searching. Invalid handling of reg->dmin in forward_search_range() could result in an invalid pointer dereference, as an out-of-bounds read from a stack buffer.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Ruby 'Oniguruma-mod' and PHP 'mbstring' parse_char_class Denial of Service — High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

An issue was discovered in Oniguruma 6.2.0, as used in Oniguruma-mod in Ruby through 2.4.1 and mbstring in PHP through 7.1.5. A heap out-of-bounds write occurs in bitset_set_range() during regular expression compilation due to an uninitialized variable from an incorrect state transition. An incorrect state transition in parse_char_class() could create an execution path that leaves a critical local variable uninitialized until it's used as an index, resulting in an out-of-bounds write memory corruption.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

Ruby 'Oniguruma-mod' and PHP unicode_unfold_key in 'mbstring' Buffer Overflow

High

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

An issue was discovered in Oniguruma 6.2.0, as used in Oniguruma-mod in Ruby through 2.4.1 and mbstring in PHP through 7.1.5. A stack out-of-bounds write in onigenc_unicode_get_case_fold_codes_by_str() occurs during regular expression compilation. Code point 0xFFFFFFFF is not properly handled in unicode_unfold_key(). A malformed regular expression could result in 4 bytes being written off the end of a stack buffer of expand_case_fold_string() during the call to onigenc_unicode_get_case_fold_codes_by_str(), a typical stack buffer overflow.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba Remote Code Execution Vulnerability High

Solution Details

Please upgrade to the most current stable release of Samba, available at http://www.samba.org.
Workarounds:
Add the parameter:

nt pipe support = no

to the [global] section of your smb.conf and restart smbd. This
prevents clients from accessing any named pipe endpoints. Note this
can disable some expected functionality for Windows clients.

Vulnerability Details

Samba since version 3.5.0 and before 4.6.4, 4.5.10 and 4.4.14 is vulnerable to remote code execution vulnerability, allowing a malicious client to upload a shared library to a writable share, and then cause the server to load and execute it.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba Security Advisory January 2022 — High

Solution Details

Please upgrade to the latest version.

Vulnerability Details

Samba vulnerabilities range from a race condition (CVE-2021-43566) to a privilege escalation vulnerability (CVE_2021-44142). The race condition and sensitive information vulnerability require SMB1 and/or share available by NFS.

CVE-2021-44142: Requires Samba versions with vfs_fruit configured which allows an out-of-bounds read/write. A remote attacker with write access to extended file attributes can execute arbitrary code with the privileges of smbd, typically root.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 2.5

SNMP Writeable Communities — High

Solution Details

SNMP should be disabled if it is not required on this host. If SNMP is required, writeable community strings should have their permission changed to be read only. If SNMP is required and writeable community strings are necessary, these strings should be configured to be difficult for an attacker to guess. Below are some sample methods for changing SNMP community strings on common platforms.

Cisco routers:
In Enable mode, type:
'snmp-server community ' to add a specified community string.
'no snmp-server community ' to remove a specified community string.
'no snmp-server' to disable the SNMP server.

HP JetDirect:
The read-only community strings of 'public' and 'internal' cannot be changed. These strings are used by the JetAdmin software, and are hard coded into the firmware. Please contact HP directly to find out how to properly secure a HP Printer. It is possible to change the write community string by typing the following via a TELNET session:
set-cmnty-name: NewString

The only valid workaround for this vulnerability on a HP JetDirect printer is to disable SNMP using the following command via TELNET:
snmp-config: 0

Without SNMP, the Embedded WebServer will not function properly, so it is recommended that EWS be disabled using the following command via TELNET: ews-config: 0

SNMP can be disabled in more recent versions of the JetDirect firmware. If this command is not available, please upgrade the printer firmware to the latest available.

Canon imageRUNNER:
Manage the SNMP settings through the administration console by navigating through: "Settings / Registration" > "Preferences" > "Network" > "SNMP Settings"

Other systems:
Consult the system's documentation or contact the system's vendor for further assistance.
Caveats:
In certain hosts, default community strings with writeable permissions are required. Changing these strings to read-only could cause other services and devices to not function properly.

Vulnerability Details

Hosts running the SNMP service use community strings to authenticate. This host was found to have default communities that have writeable permissions. A writeable community string allows data in the MIB to be written and changed. An attacker can use this vulnerability to gain information about the host and its environment, as well as change the host's configuration.

Impact:
A writeable community string gives the user access to a variety of management tasks such as rerouting network traffic, enabling or disabling services, and executing commands. Attackers can use this to fully compromise this host and potentially compromise other hosts on the network.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Unquoted Windows Service Path Vulnerability — High

Vulnerability Details

This host has one or more Windows services that use an unquoted string that contains spaces to specify the path to the image that the service uses. This creates the potential for an unprivileged local user to elevate their privileges to that which the service runs under by placing a rogue executable in a user-accessible path which causes the service to load this executable instead.

As an example, a path such as C:\Program Files\Symantec\bin\symsrv.exe when used to specify the service, creates a potential hijack location if a user places a file called "Program.exe" in the C:\. Because the path is unquoted, Windows will read the string up to the space and attempt to load a file from that path by appending an extension. Thus, it will instead load C:\Program.exe.
Impact:
A malicious local user who has limited privileges can abuse this vulnerability to gain elevated permissions and gain full control over this host. Permissions granted are relative to the account under which the affected service runs.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Make sure that any Windows service which has a path that contains a space in it is enclosed in quotations. This can be done manually by editing the service. Additionally, the vendor of the software product which creates this service should be contacted to inform them of this vulnerability.

CVSS Base Score: 7.2

VMware Security Advisory: VMSA-2015-0007 — High

Solution Details

VMware has released a fix for this flaw which can be downloaded from the VMware update catalog.

Vulnerability Details

This asset is affected by one or more vulnerabilities that could result in denial of service or potentially remote code execution. Please see the vendor advisory, linked in the External References section, for more information.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:P

Web Server Directory Traversal High

False Positive Notes

This item is not a false positive. Appropriate remediation is required.

Solution Details

Please ensure all user supplied input is sanitized before use as a path for file access. If this web application was provided by a third party vendor, please contact the vendor for specific remediation instructions.

Vulnerability Details

The remote host is running a web server, web service, or web application that contains a directory traversal vulnerability. A remote, unauthenticated attacker can leverage this vulnerability to retrieve arbitrary files and possibly execute arbitrary programs on the remote host, including those which reside outside of the web root.

This arbitrary access to files and programs can be accomplished by submitting an HTTP GET request for a URL which contains a variation of '../'. An example of the path which was used to retrieve an arbitrary file from the vulnerable system is included in the data section of this vulnerability.

CVSS Base Score: 7.8

CVSS Vector: AV:N/AC:L/Au:N/C:C/I:N/A:N

Type	Reference
URL	https://cwe.mitre.org/data/definitions/22.html

Windows 10 End of Life High

Solution Details

Upgrade to a supported version of Windows 10.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This asset is running a version of Windows 10 that has reached end of life status. As such, newly discovered vulnerabilities will no longer be patched by the vendor.
Impact:
Even though vulnerabilities in this version of Windows 10 may exist, Microsoft will not patch them. Should any vulnerabilities exist, an attacker might be able to leverage them to gain unauthorized access to this asset or its data.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
URL	https://support.microsoft.com/en-us/help/13853/windows-lifecycle-fact-sheet

Windows EFSRPC NTLM Relay Vulnerability (PetitPotam) High

Solution Details

Microsoft has provided a patch for this vulnerability. Additionally, there are other mitigation steps that can be taken that include disabling NTLM authentication and implementing RPC filters to block requests to the affected RPC interface.

Please refer to the external references section and specifically to the documentation provided by Microsoft on how to address this vulnerability.

Vulnerability Details

This asset is running a version of Windows that is susceptible to an NTLM relay attack via the EFSRPC interface. It is possible for an unauthenticated attacker to send a specially crafted RPC request to this interface and cause the target to connect to a malicious relay server which can then impersonate the target to authenticate against remote services.
Impact:
Exploitation of this vulnerability against a domain controller target can result in the complete compromise of the domain.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5.3

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:N/I:L/A:N

URL	https://github.com/topotam/PetitPotam

Zend NULL Pointer Denial of Service — High

Vulnerability Details

Zend/zend_exceptions.c in PHP before 5.4.44, 5.5.x before 5.5.28, and 5.6.x before 5.6.12 does not validate certain Exception objects, which allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) or trigger unintended method execution via crafted serialized data.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

CVSS Base Score: 9.8

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H

Type	Reference
CVE	https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2015-8876
URL	https://bugs.php.net/bug.php?id=70121

Apache httpd Digest Authorization Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

In Apache httpd before 2.2.34 and 2.4.x before 2.4.27, the value placeholder in [Proxy-]Authorization headers of type 'Digest' was not initialized or reset before or between successive key=value assignments by mod_auth_digest. Providing an initial key with no '=' assignment could reflect the stale value of uninitialized pool memory used by the prior request, leading to leakage of potentially confidential information, and a segfault in other cases resulting in denial of service.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.4

CVSS Vector: AV:N/AC:L/Au:N/C:P/I:N/A:P

Apache HTTP 'HTTP/2 mod' Denial of Service Vulnerability — Medium

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

Vulnerability Details

When trace/debug was enabled for the HTTP/2 module and on certain traffic edge patterns, logging statements were made on the wrong connection, causing concurrent use of memory pools.
Impact:
An attacker can exploit this vulnerability to cause a denial-of-service condition, denying service to legitimate users.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

CVSS Vector: AV:N/AC:M/Au:N/C:N/I:N/A:P

URL	https://httpd.apache.org/download.cgi

Apache HTTP "RequestHeader unset" Directive Bypass Vulnerability Medium

Vulnerability Details

HTTP trailers could be used to replace HTTP headers late during request processing, potentially undoing or otherwise confusing modules that examined or modified request headers earlier.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to version 2.4.12 or later.

CVSS Base Score: 5

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:P/A:N

Apache HTTP Server 'ap_some_auth_required' Function Remote Access Restrictions Bypass Vulnerability

Medium

Vulnerability Details

The ap_some_auth_required function in server/request.c in the Apache HTTP Server 2.4.x before 2.4.14 does not consider that a Require directive may be associated with an authorization setting rather than an authentication setting, which allows remote attackers to bypass intended access restrictions in opportunistic circumstances by leveraging the presence of a module that relies on the 2.2 API behavior.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

Apache HTTP Server 'Cache-Digest' Denial of Service Vulnerability — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Apache HTTP Server.
Workarounds:
Configuring the HTTP/2 feature via "H2Push off" will mitigate this vulnerability for unpatched servers.

Vulnerability Details

A specially crafted value for the 'Cache-Digest' header in a HTTP/2 request would result in a crash when the server actually tries to HTTP/2 PUSH a resource afterwards.
Impact:
An attacker can exploit this vulnerability to cause a denial-of-service condition, denying service to legitimate users.

CVSS Base Score: 5

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:P

Type	Reference
CVE	https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2020-9490
URL	https://httpd.apache.org/download.cgi

Apache HTTP Server 'cache_merge_headers_out' Function Denial of Service Vulnerability — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to version 2.4.12 or later.

Vulnerability Details

A NULL pointer deference was found in mod_cache. A malicious HTTP server could cause a crash in a caching forward proxy configuration. This crash would only be a denial of service if using a threaded MPM.

CVSS Base Score: 5

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:P

Apache HTTP Server Crafted Request Denial of Service Vulnerability — Medium

Vulnerability Details

By specially crafting HTTP/2 requests, workers would be allocated 60 seconds longer than necessary, leading to worker exhaustion and a denial of service.
Impact:
An attacker could cause a denial of service condition on the asset.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Refer to External References for a link to download and update to the most recent stable version of Apache HTTP Server.

CVSS Base Score: 5

Apache HTTP Server 'deflate_in_filter' Function Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

The deflate_in_filter function in mod_deflate.c in the mod_deflate module in the Apache HTTP Server before 2.4.10, when request body decompression is enabled, allows remote attackers to cause a denial of service (resource consumption) via crafted request data that decompresses to a much larger size.

Apache HTTP Server Digest Authentication Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

In Apache HTTP Server versions 2.4.0 to 2.4.23, malicious input to mod_auth_digest can cause the server to crash, and each instance continues to crash even for subsequently valid requests.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server HTTP Chunked Request Smuggling Attack — Medium

Solution Details

Upgrade to version 2.2.31 or 2.4.16 or later.

Vulnerability Details

An HTTP request smuggling attack was possible due to a bug in parsing of chunked requests. A malicious client could force the server to misinterpret the request length, allowing cache poisoning or credential hijacking if an intermediary proxy is in use.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'httpd' URL Normalization Inconsistency Vulnerability	Medium

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

When the path component of a request URL contains multiple consecutive slashes ('/'), directives such as LocationMatch and RewriteRule must account for duplicates in regular expressions while other aspects of the servers processing will implicitly collapse them.
Impact:
An attacker can leverage this issue to perform unauthorized actions in the context of the asset.

Apache HTTP Server HTTP_PROXY Environment Variable Vulnerability

Medium

Vulnerability Details

HTTP_PROXY is a well-defined environment variable in a CGI process, which collided with a number of libraries which failed to avoid colliding with this CGI namespace. A mitigation is provided for the httpd CGI environment to avoid populating the "HTTP_PROXY" variable from a "Proxy:" header, which has never been registered by IANA.

This workaround and patch are documented in the ASF Advisory at asf-httpoxy-response.txt and incorporated in the 2.4.25 and 2.2.32 releases.

Note: This is not assigned an httpd severity, as it is a defect in other software which overloaded well-established CGI environment variables, and does not reflect an error in HTTP server software.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to version 2.2.32 or 2.4.45 or later.

Apache HTTP Server 'lua_websocket_read' Function Denial of Service Vulnerability

Medium

Vulnerability Details

A stack recursion crash in the mod_lua module was found. A Lua script executing the r:wsupgrade() function could crash the process if a malicious client sent a carefully crafted PING request.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to version 2.4.16 or later.

Apache HTTP Server 'mod_auth_digest' Access Control Bypass Vulnerability	Medium

Vulnerability Details

In Apache HTTP Server 2.4 release 2.4.38 and prior, a race condition in mod_auth_digest when running in a threaded server could allow a user with valid credentials to authenticate using another username, bypassing configured access control restrictions.
Impact:
An attacker could exploit this vulnerability to access the target asset in the context of another user, allowing them to perform unauthorized actions from that account, possibly aiding in further attacks.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'mod_cache_socache' Out of Bound Read Denial of Service Vulnerability

Medium

Solution Details

Upgrade to version 2.4.33 or later.

Vulnerability Details

A specially crafted HTTP request header could have crashed the Apache HTTP Server prior to version 2.4.33 due to an out of bound read while preparing data to be cached in shared memory. It could be used as a Denial of Service attack against users of mod_cache_socache.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'mod_cgid' Module Denial of Service

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The mod_cgid module in the Apache HTTP Server before 2.4.10 does not have a timeout mechanism, which allows remote attackers to cause a denial of service (process hang) via a request to a CGI script that does not read from its stdin file descriptor.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'mod_dav' Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The dav_xml_get_cdata function in main/util.c in the mod_dav module in the Apache HTTP Server before 2.4.8 does not properly remove whitespace characters from CDATA sections, which allows remote attackers to cause a denial of service (daemon crash) via a crafted DAV WRITE request.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'mod_http2' Memory Corruption Vulnerability — Medium

Vulnerability Details

HTTP/2 very early pushes, for example configured with "H2PushResource", could lead to an overwrite of memory in the pushing request's pool, leading to crashes. The memory copied is that of the configured push link header values, not data supplied by the client.
Impact:
An attacker can exploit this vulnerability to cause a denial-of-service condition, denying service to legitimate users.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

CVSS Base Score: 5

URL	https://httpd.apache.org/download.cgi

Apache HTTP Server 'mod_http2' Module Denial of Service Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The mod_http2 module in the Apache HTTP Server 2.4.17 through 2.4.23, when the Protocols configuration includes h2 or h2c, does not restrict request-header length, which allows remote attackers to cause a denial of service (memory consumption) via crafted CONTINUATION frames in an HTTP/2 request.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'mod_http2' Read-After-Free (CVE-2019-0196) — Medium

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

Vulnerability Details

Using fuzzed network input, the http/2 request handling could be made to access freed memory in string comparision when determining the method of a request and thus process the request incorrectly.
Impact:
An attacker could exploit this vulnerability and get more information about the targeted asset, possibly aiding in further attacks.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'mod_lua' Access Restriction Bypass Vulnerability

Medium

Vulnerability Details

mod_lua.c in the mod_lua module in the Apache HTTP Server 2.3.x and 2.4.x through 2.4.10 does not support an httpd configuration in which the same Lua authorization provider is used with different arguments within different contexts, which allows remote attackers to bypass intended access restrictions in opportunistic circumstances by leveraging multiple Require directives, as demonstrated by a configuration that specifies authorization for one group to access a certain directory, and authorization for a second group to access a second directory.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Apache HTTP Server 'mod_proxy' Cross-Site Scripting Vulnerability — Medium

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

Vulnerability Details

A limited cross-site scripting issue was reported affecting the mod_proxy error page. An attacker could cause the link on the error page to be malformed and instead point to a page of their choice. This would only be exploitable where a server was set up with proxying enabled but was misconfigured in such a way that the Proxy Error page was displayed.
Impact:
An attacker could leverage this vulnerability to redirect users to a page of the attacker's choice which could lead to a disclosure of sensitive information.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

Apache HTTP Server 'mod_rewrite' Redirect Vulnerability — Medium

Vulnerability Details

Redirects configured with 'mod_rewrite' that were intended to be self-referential might be fooled by encoded newlines and redirect instead to an an unexpected URL within the request URL.
Impact:
Exploiting these issues will allow an attacker to bypass security restrictions or construct a crafted URI and enticing a user to follow it. When an unsuspecting victim follows the link, they may be redirected to an attacker-controlled site; this may aid in phishing attacks.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'mod_session_cookie' Expiry Time Ignored Vulnerability — Medium

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

Vulnerability Details

In Apache HTTP Server 2.4 release 2.4.37 and prior, mod_session checks the session expiry time before decoding the session. This causes session expiry time to be ignored for mod_session_cookie sessions since the expiry time is loaded when the session is decoded.
Impact:
An attacker can leverage this issue to perform unauthorized actions. This may aid in further attacks.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'mod_status' Module Race Condition — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Race condition in the mod_status module in the Apache HTTP Server before 2.4.10 allows remote attackers to cause a denial of service (heap-based buffer overflow), or possibly obtain sensitive credential information or execute arbitrary code, via a crafted request that triggers improper scoreboard handling within the status_handler function in modules/generators/mod_status.c and the lua_ap_scoreboard_worker function in modules/lua/lua_request.c.

CVSS Base Score: 6.8

Apache HTTP Server 'mod_userdir' CRLF Injection Vulnerability — Medium

Vulnerability Details

Possible CRLF injection allowing HTTP response splitting attacks for sites which use mod_userdir. This issue was mitigated by changes made in 2.4.25 and 2.2.32 which prohibit CR or LF injection into the "Location" or other outbound header key or value. Fixed in Apache HTTP Server 2.4.25 (Affected 2.4.1-2.4.23). Fixed in Apache HTTP Server 2.2.32 (Affected 2.2.0-2.2.31).
Impact:
Attackers can leverage this issue to influence or misrepresent how web content is served, cached, or interpreted. This could aid in various attacks that try to entice client users into having a false sense of trust.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most current version of Apache HTTP Server.

CVSS Base Score: 4.3

Apache HTTP Server Multiple Vulnerabilities — Medium

Vulnerability Details

CVE-2017-15710
mod_authnz_ldap, if configured with AuthLDAPCharsetConfig, uses the Accept-Language header value to lookup the right charset encoding when verifying the user's credentials.
If the header value is not present in the charset conversion table, a fallback mechanism is used to truncate it to a two characters value to allow a quick retry (for example, 'en-US' is truncated to 'en'). A

header value of less than two characters forces an out of bound write of one NUL byte to a memory location that is not part of the string. In the worst case, quite unlikely, the process would crash which could be used as a Denial of Service attack. In the more likely case, this memory is already reserved for future use and the issue has no effect at all.

CVE-2017-15715
The expression specified in <FilesMatch> could match '$' to a newline character in a malicious filename, rather than matching only the end of the filename.
This could be exploited in environments where uploads of some files are are externally blocked, but only by matching the trailing portion of the filename.

CVE-2018-1283
When mod_session is configured to forward its session data to CGI applications (SessionEnv on, not the default), a remote user may influence their content by using a "Session" header.
This comes from the "HTTP_SESSION" variable name used by mod_session to forward its data to CGIs, since the prefix "HTTP_" is also used by the Apache HTTP Server to pass HTTP header fields, per CGI specifications.

CVE-2018-1301
A specially crafted request could have crashed the Apache HTTP Server prior to version 2.4.33, due to an out of bound access after a size limit is reached by reading the HTTP header. This vulnerability is considered very hard if not impossible to trigger in non-debug mode (both log and build level), so it is classified as low risk for common server usage.

CVE-2018-1302
When an HTTP/2 stream was destroyed after being handled, the Apache HTTP Server prior to version 2.4.33 could have written a NULL pointer potentially to an already freed memory.
The memory pools maintained by the server make this vulnerabilty hard to trigger in usual configurations, the reporter and the team could not reproduce it outside debug builds, so it is classified as low risk.

CVE-2018-1303
A specially crafted HTTP request header could have crashed the Apache HTTP Server prior to version 2.4.33 due to an out of bound read while preparing data to be cached in shared memory. It could be used as a Denial of Service attack against users of mod_cache_socache.

CVE-2018-1312
When generating an HTTP Digest authentication challenge, the nonce sent to prevent reply attacks was not correctly generated using a pseudo-random seed.
In a cluster of servers using a common Digest authentication configuration, HTTP requests could be replayed across servers by an attacker without detection.

Solution Details

Upgrade to version 2.4.33 or later.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server Padding Oracle Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

In Apache HTTP Server versions 2.4.0 to 2.4.23, mod_session_crypto was encrypting its data/cookie using the configured ciphers with possibly either CBC or ECB modes of operation (AES256-CBC by default), hence no selectable or builtin authenticated encryption. This made it vulnerable to padding oracle attacks, particularly with CBC.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server Response Splitting Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Apache HTTP Server, in all releases prior to 2.2.32 and 2.4.25, was liberal in the whitespace accepted from requests and sent in response lines and headers. Accepting these different behaviors represented a security concern when httpd participates in any chain of proxies or interacts with back-end application servers, either through mod_proxy or using conventional CGI mechanisms, and may result in request smuggling, response splitting and cache pollution.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server 'SETTINGS' Denial of Service Vulnerability — Medium

Vulnerability Details

In Apache HTTP Server 2.4.17 to 2.4.34, by sending continuous, large SETTINGS frames a client can occupy a connection, server thread and CPU time without any connection timeout coming to effect. This affects only HTTP/2 connections. A possible mitigation is to not enable the h2 protocol.
Impact:
An attacker could cause a denial of service condition on the asset.

Solution Details

Refer to External References for a link to download and update to the most recent stable version of Apache HTTP Server.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server Slow Request Bodies Denial of Service Vulnerability

Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

By sending request bodies in a slow loris way to plain resources, the h2 stream for that request unnecessarily occupied a server thread cleaning up that incoming data. This affects only HTTP/2 connections.
Impact:
Attackers may leverage this issue to cause a denial-of-service condition, denying service to legitimate users.

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

CVSS Base Score: 5

Apache HTTP Server URL Redirect Vulnerability — Medium

Vulnerability Details

Redirects configured with mod_rewrite that were intended to be self-referential might be fooled by encoded newlines and redirect instead to an unexpected URL within the request URL.
Impact:
An attacker could leverage this vulnerability to redirect users to a page of the attacker's choice which could lead to a disclosure of sensitive information.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Apache HTTP Server.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache HTTP Server winnt_accept Function Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Memory leak in the winnt_accept function in server/mpm/winnt/child.c in the WinNT MPM in the Apache HTTP Server 2.4.x before 2.4.10 on Windows, when the default AcceptFilter is enabled, allows remote attackers to cause a denial of service (memory consumption) via crafted requests.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Apache 'Optionsbleed' UAF Memory Leak — Medium

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Apply the patch provided by the vendor
Workarounds:
This bug is produced when the Limit directive in an .htaccess file is misused, as below, by specifying a bogus header value:

```
"
<Limit bogusheader>
</Limit>
"
```

If applying the provided patch is not feasible, please ensure that all Limit directives used within .htaccess files are validated.

Vulnerability Details

CVE-2017-9798, 'Optionbleed', is a use after free error in the Apache web server that causes a corrupted Allow header to be returned in response to OPTIONS requests. Due to the nature of this vulnerability, exploitation is not deterministic, and requires multiple requests in order to attempt to determine if the vulnerability is present or not.
Impact:
A remote, unauthenticated attacker could leverage this vulnerability to obtain arbitrary pieces of

memory from the affected asset. The memory leaked changes over time with multiple requests, potentially allowing an attacker to gather a large amount of information, possibly including sensitive data.

CVSS Base Score: 5

Heimdal Man-in-the-Middle Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Heimdal before 7.4 allows remote attackers to impersonate services with Orpheus' Lyre attacks because it obtains service-principal names in a way that violates the Kerberos 5 protocol specification. In _krb5_extract_ticket() the KDC-REP service name must be obtained from the encrypted version stored in 'enc_part' instead of the unencrypted version stored in 'ticket'. Use of the unencrypted version provides an opportunity for successful server impersonation and other attacks. NOTE: this CVE is only for Heimdal and other products that embed Heimdal code; it does not apply to other instances in which this part of the Kerberos 5 protocol specification is violated.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Java Debugging Port Accessible — Medium

Solution Details

Remote debugging is not typically a necessary service. If remote debugging is not being performed, then consider disabling the debugging server. If the debugging server is necessary, restrict the IP addresses from which connections to the debugging service are accepted.

Vulnerability Details

The remote host is running a Java debugging server that is accessible via the network. A remote unauthenticated attacker can use this service to view, modify, and control execution of programs in the memory space of the exposed Java Virtual Machine (JVM) environment. Impact includes the possibility of denial of service as well as the disclosure of sensitive information that is available through the accessible memory space, such as passwords.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

jQuery Cross-Site Scripting Vulnerability — Medium

Solution Details

Upgrade to version 3.5.0 or later. Downloads available at the following link:

https://jquery.com/download/

Vulnerability Details

In jQuery library, passing HTML from untrusted sources - even after sanitizing it - to one of jQuery's DOM manipulation methods (i.e. .html(), .append(), and others) may execute untrusted code.

Impact:
An attacker may leverage this issue to execute arbitrary HTML and script code in the browser of an unsuspecting user in the context of the affected site. This may let the attacker obtain information that could aid in launching further attacks.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

CVSS Vector: AV:N/AC:M/Au:N/C:N/I:P/A:N

LDAP Channel Binding Vulnerability — Medium

Solution Details

Refer to the external links section for a detailed explanation of how to modify the registry in order to change this setting, which should be enabled by default after the March 2020 rollup is applied.

Registry setting for Active Directory Domain Services (AD DS) domain controllers mitigation:
key => HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\NTDS\Parameters
value type => DWORD
value name => LdapEnforceChannelBinding
value data => 2

Vulnerability Details

A set of unsafe default configurations for LDAP channel binding exist on Active Directory Domain Controllers which permit LDAP clients to communicate without enforcing LDAP channel binding.
Impact:
Active Directory Domain Controllers could potentially be susceptible to an Elevation of Privilege attack.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 2.7

LDAP Signing Vulnerability — Medium

Solution Details

Refer to the external links section for a detailed explanation of how to set specific GPO settings or modify the registry in order to change this setting, which should be enabled by default after the March 2020 rollup is applied.

To make changes via Group Policy Settings:
1. Set Server signing requirement:
a. Goto the Domain Controller Policy you wish to modify and edit via Group Policy Mgmt.
b. Goto Computer Configuration>Policies>Windows Settings>Security Settings>Local Policies>Security Options
c. Set Domain controller: LDAP server signing requirements to require signing

2. Set Client signing requirement:
a. Goto the Domain Policy you wish to modify and edit via Group Policy Mgmt.
b. Goto Computer Configuration>Policies>Windows Settings>Security Settings>Local Policies>Security Options
c. Set Network security: LDAP client signing requirements to require signing

Vulnerability Details

A set of unsafe default configurations for LDAP signing exist on Active Directory Domain Controllers which permit LDAP clients to communicate without enforcing LDAP signing.
Impact:
Active Directory Domain Controllers could potentially be susceptible to an Elevation of Privilege attack.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

libxml 'libxml_disable_entity_loader' XXE and XEE Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/libxml/libxml.c in PHP before 5.5.22 and 5.6.x before 5.6.6, when PHP-FPM is used, does not isolate each thread from libxml_disable_entity_loader changes in other threads, which allows remote attackers to conduct XML External Entity (XXE) and XML Entity Expansion (XEE) attacks via a crafted XML document, a related issue to CVE-2015-5161.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

MS09-001 SMB Remote Code Execution (Network Check) — Medium

Solution Details

Microsoft released Security Bulletin MS09-001 to address these issues. Please obtain and apply the appropriate Microsoft updates as described at

http://www.microsoft.com/technet/security/Bulletin/MS09-001.mspx.
A workaround is to block TCP ports 139 and 445 at the firewall, although multiple Windows services using these ports may not function.

Vulnerability Details

This host is running a version of Microsoft Windows which is vulnerable to a remote command execution flaw within the Server service. Remote attackers can leverage a NT Trans2 request with crafted SMB packets using malformed field values to execute arbitrary commands with user privileges. Unauthenticated attackers can also leverage the Server service with crafted SMB packets to gain control of this host or cause a denial of service.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 10

MS10-012 Vulnerabilities In SMB Server Allow Remote Code Execution (Network Check)	Medium

Vulnerability Details

The Microsoft Windows implementation of the Server Message Block (SMB) protocol fails to provide enough entropy to the NTLM authentication mechanism. This flaw in the SMB implementation allows duplicate nonces to be issued by the authenticating server, which can in turn be leveraged by an attacker to gain access to the system without knowledge of system credentials.

A nonce is an authentication challenge that should not be used more than once, and is an essential component of SMB NTLM authentication which allows users to authenticate with remote SMB servers.

An attacker can use a duplicate nonce in a replay attack which will allow him to be authenticated by the vulnerable server. Once authenticated, the attacker can perform actions under the context of the account that was used to gain access to the server.

The presence of this vulnerability implies the absence of Microsoft patch MS10-012 as well as the existence of several other vulnerabilities in the SMB implementation. The other vulnerabilities include an unauthenticated memory corruption flaw, an unauthenticated null pointer denial of service flaw, and an authenticated pathname overflow flaw.
Impact:
The MS10-012 patch provides a fix for multiple vulnerabilities that are present in the SMB implementation. Each of the vulnerabilities has a different level of impact. The impact ranges from initiating a denial of service condition on the vulnerable host, to gaining complete access to the machine and other hosts on the network.

Solution Details

Microsoft has released updates to address this issue. If automatic updating is not enabled, please obtain the appropriate update as described in the MS10-012 Security Bulletin linked in the References List of the vulnerability details. Hosts connected to the Internet should have a minimal number of ports exposed. All unsolicited inbound communication from the Internet should be blocked as well. A workaround is to block TCP ports 139 and 445 which are used by the affected component, although other applications or services using these ports may be interrupted.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS11-020: SMB Transaction Parsing Vulnerability (Network Check) — Medium

Vulnerability Details

This instance of the Microsoft SMB Server service contains an SMB transaction parsing vulnerability. A remote attacker can leverage this flaw to execute arbitrary code on the vulnerable host.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft patch MS11-020 addresses this vulnerability. Apply MS11-020 to the vulnerable system either directly or through the standard Microsoft Update mechanism.

MS14-085: Vulnerability in Microsoft Graphics Component Could Allow Information Disclosure — Medium

Vulnerability Details

This security update resolves a publicly disclosed vulnerability in Microsoft Windows. The vulnerability could allow information disclosure if a user browses to a website containing specially crafted JPEG content. An attacker could use this information disclosure vulnerability to gain information about the system that could then be combined with other attacks to compromise the system. The information disclosure vulnerability by itself does not allow arbitrary code execution. However, an attacker could use this information disclosure vulnerability in conjunction with another vulnerability to bypass security features such as Address Space Layout Randomization (ASLR).

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS14-

085'.

Affected Products Are:
- Microsoft Windows Server 2003
- Microsoft Windows Server 2003 x64 Edition
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (server core installation)
- Windows Vista
- Windows Vista x64 Edition

Solution Details

Microsoft has released a fix for this flaw in their 'MS14-085' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine. This patch does not require a reboot.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS15-001: Vulnerability in Windows Application Compatibility Cache Could Allow Elevation of Privilege

Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-001' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine. This patch does not require a reboot.

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker sending malformed input to the affected service to force it to disclose sensitive information not normally available.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-001'.

Affected Products Are:
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (server core installation)

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS15-004: Vulnerability in Windows Components Could Allow Elevation of Privilege

Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-004' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine. This patch does not require a reboot.

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker with unprivileged access to the affected component to leverage input validation flaws to upgrade their privileges to that of a privileged user

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-004'.

Affected Products Are:
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)

MS15-005: Vulnerability in Network Location Awareness Service Could Allow Security Feature Bypass

Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-005' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine. This patch does not require a reboot.

Vulnerability Details

The remote Windows host is affected by a 'Security Bypass' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker with unprivileged access to the affected component to leverage input validation flaws to upgrade their privileges to that of a privileged user

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-005'.

Affected Products Are:
- Microsoft Windows Server 2003
- Microsoft Windows Server 2003 x64 Edition
- Windows 7
- Windows 8

MS15-016: Vulnerability in Microsoft Graphics Component Could Allow Information Disclosure

Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-016' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine. This patch does not require a reboot.

Vulnerability Details

The remote Windows host is affected by a 'Information Disclosure' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker with unprivileged access to the affected component to leverage input validation flaws to upgrade their privileges to that of a privileged user

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-016'.

Affected Products Are:
- Microsoft Windows Server 2003
- Microsoft Windows Server 2003 x64 Edition
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (server core installation)
- Windows Vista
- Windows Vista x64 Edition

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS15-023: Vulnerabilities in Kernel-Mode Driver Could Allow Elevation of Privilege

Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-023' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine. This patch does not require a reboot.

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow a remote attacker to leverage malformed input to the affected component to execute arbitrary code with the privileges of the running process.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-023'.

Affected Products Are:
- Microsoft Windows Server 2003
- Microsoft Windows Server 2003 x64 Edition
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (server core installation)
- Windows Vista
- Windows Vista x64 Edition

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS15-025: Vulnerabilities in Windows Kernel Could Allow Elevation of Privilege

Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-025' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine. This patch does not require a reboot.

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker sending malformed input to the affected service to force it to disclose sensitive information not normally available.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-025'.

Affected Products Are:
- Microsoft Windows Server 2003
- Microsoft Windows Server 2003 x64 Edition
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2008

MS15-027: Vulnerability in NETLOGON Could Allow Spoofing — Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-027' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine. This patch does not require a reboot.

Vulnerability Details

The remote Windows host is affected by a 'Spoofing' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker with unprivileged access to the affected component to leverage input validation flaws to upgrade their privileges to that of a privileged user

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-027'.

Affected Products Are:
- Microsoft Windows Server 2003
- Microsoft Windows Server 2003 x64 Edition
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012

MS15-060: Vulnerability in Microsoft Common Controls Could Allow Remote Code Execution

Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-060' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine.

Vulnerability Details

The remote Windows host is affected by a 'Remote Code Execution' flaw which could compromise its security posture.

The vulnerability in question could allow a remote attacker to leverage malformed input to the affected component to execute arbitrary code with the privileges of the running process.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-060'.

Affected Products Are:
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (server core installation)
- Windows Vista
- Windows Vista x64 Edition

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 9.3

MS15-061: Vulnerabilities in Windows Kernel-Mode Drivers Could Allow Elevation of Privilege	Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-061' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine.

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow a remote attacker to leverage malformed input to the affected component to execute arbitrary code with the privileges of the running process.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-061'.

Affected Products Are:
- Microsoft Windows Server 2003
- Microsoft Windows Server 2003 x64 Edition
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2003 R2
- Windows Server 2003 R2 x64 Edition
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (server core installation)
- Windows Vista
- Windows Vista x64 Edition

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS15-071: Vulnerability in Netlogon Could Allow Elevation of Privilege

Medium

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow a remote attacker to leverage malformed input to the affected component to execute arbitrary code with the privileges of the running process.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-071'.

Affected Products Are:
- Microsoft Windows Server 2003
- Microsoft Windows Server 2003 x64 Edition
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2003 R2
- Windows Server 2003 R2 x64 Edition
- Windows Server 2008
- Windows Server 2008 R2

MS15-072: Vulnerability in Windows Graphics Component Could Allow Elevation of Privilege

Medium

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker with unprivileged access to the affected component to leverage input validation flaws to upgrade their privileges to that of a privileged user

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-072'.

Affected Products Are:
- Microsoft Windows Server 2003
- Microsoft Windows Server 2003 x64 Edition
- Windows 7
- Windows 8

- Windows 8.1
- Windows RT
- Windows RT 8.1

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker with unprivileged access to the affected component to leverage input validation flaws to upgrade their privileges to that of a privileged user

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-119'.

Affected Products Are:
- Windows 10
- Windows 10 Version 1511
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (server core installation)
- Windows Vista
- Windows Vista x64 Edition

Solution Details

Microsoft has released a fix for this flaw in their 'MS15-119' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS15-121: Security Update for Schannel to Address Spoofing

Medium

Vulnerability Details

The remote Windows host is affected by a 'Spoofing' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker sending malformed input to the affected service to knock it offline, denying service to legitimate users.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS15-121'.

Affected Products Are:
- Windows 7
- Windows 8
- Windows 8.1
- Windows RT
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012

MS16-047: Windows SAM and LSAD Downgrade Vulnerability - Badlock (Network Check) Medium

Solution Details

Apply the update provided by the vendor to address this issue. If you are using an operating system that is no longer supported, upgrade the asset to a supported operating system in order to obtain a patch for this vulnerability.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This asset is vulnerable to a privilege escalation Man in The Middle (MiTM) attack due to SAM and LSAD RPC services permitting weak authentication levels, which do not provide adequate protection, during channel establishment.
Impact:
A remote, unauthenticated attacker in position to perform a Man in The Middle (MiTM) attack could intercept a legitimate user's traffic, force a downgrade of the authentication level then impersonate that user, with access to all privileges available to that user.

CVSS Base Score: 5.8

MS16-060: Security Update for Windows Kernel — Medium

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow a remote attacker to leverage malformed input to the affected component to execute arbitrary code with the privileges of the running process.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS16-060'.

Affected Products Are:
- Microsoft Windows Server 2003
- Windows 10
- Windows 10 Version 1511
- Windows 7
- Windows 8.1
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2

- Windows Server 2012 R2 (server core installation)
- Windows Vista
- Windows Vista x64 Edition

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their 'MS16-060' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine.

MS16-061: Security Update for Microsoft RPC — Medium

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker with unprivileged access to the affected component to leverage input validation flaws to upgrade their privileges to that of a privileged user

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS16-061'.

Affected Products Are:
- Windows 10
- Windows 10 Version 1511
- Windows 7
- Windows 8.1
- Windows Server 2008

- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (server core installation)
- Windows Vista
- Windows Vista x64 Edition

Solution Details

Microsoft has released a fix for this flaw in their 'MS16-061' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine.

MS16-065: Security Update for .NET Framework — Medium

Solution Details

Microsoft has released a fix for this flaw in their 'MS16-065' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

The remote Windows host is affected by an 'Information Disclosure' flaw which could compromise its security posture.

The vulnerability in question could allow a remote attacker to leverage malformed input to the affected component to execute arbitrary code with the privileges of the running process.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS16-065'.

Affected Products Are:
- Windows 7

- Windows 8.1
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)

MS16-114: Security Update for Windows SMBv1 Server — Medium

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

The remote Windows host is affected by a 'Remote Code Execution' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker sending malformed input to the affected service to force it to disclose sensitive information not normally available.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS16-114'.

Affected Products Are:
- Windows 10
- Windows 10 Version 1511
- Windows 10 Version 1607
- Windows 7

- Windows 8.1
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (Server Core installation)
- Windows Vista
- Windows Vista x64 Edition

Solution Details

Microsoft has released a fix for this flaw in their 'MS16-114' update. Please download and install the patch from Microsoft Technet or run Windows Update on the affected machine.

CVSS Base Score: 8.8

MS16-134: Security Update for Common Log File System Driver — Medium

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow a remote attacker to leverage malformed input to the affected component to execute arbitrary code with the privileges of the running process.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS16-134'.

Affected Products Are:
- Windows 10
- Windows 10 Version 1511
- Windows 10 Version 1607
- Windows 7

- Windows 8.1
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (Server Core installation)
- Windows Server 2016
- Windows Vista
- Windows Vista x64 Edition

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their November 2016 Quality Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

MS16-135: Security Update for Windows Kernel-Mode Drivers — Medium

Solution Details

Microsoft has released a fix for this flaw in their November 2016 Quality Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

The remote Windows host is affected by a 'Elevation of Privilege' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker with unprivileged access to the affected component to leverage input validation flaws to upgrade their privileges to that of a privileged user

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS16-135'.

Affected Products Are:
- Windows 10
- Windows 10 Version 1511
- Windows 10 Version 1607
- Windows 7
- Windows 8.1
- Windows RT 8.1
- Windows Server 2008

- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 (Server Core installation)
- Windows Server 2012 R2
- Windows Server 2012 R2 (Server Core installation)
- Windows Server 2016
- Windows Vista
- Windows Vista x64 Edition

False Positive Notes

MS17-021: Security Update for Windows DirectShow

Medium

Vulnerability Details

The remote Windows host is affected by a 'Information Disclosure' flaw which could compromise its security posture.

The vulnerability in question could allow an attacker sending malformed input to the affected service to force it to disclose sensitive information not normally available.

Microsoft has rated this flaw 'Important' and released a fix for this in Microsoft Security Bulletin 'MS17-021'.

Affected Products Are:
- Windows 10
- Windows 10 Version 1511
- Windows 10 Version 1607
- Windows 7
- Windows 8.1
- Windows RT 8.1
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 R2
- Windows Server 2016
- Windows Vista
- Windows Vista x64 Edition

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their March 2017 Quality Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

MS17-AUG: Microsoft Internet Explorer Security Update — Medium

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2017-8625 - Internet Explorer Security Feature Bypass Vulnerability
CVE-2017-8651 - Internet Explorer Memory Corruption Vulnerability

Affected Products:
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Internet Explorer 10 on Windows Server 2012
Internet Explorer 11 on Windows 10 for 32-bit Systems

Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1511 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1511 for 32-bit Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems

Solution Details

Microsoft has released a fix for this flaw in their August 2017 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS17-JUN: Microsoft Internet Explorer Security Update — Medium

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their June 2017 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2017-8519 - Internet Explorer Memory Corruption Vulnerability
CVE-2017-8547 - Internet Explorer Memory Corruption Vulnerability

Affected Products:
Internet Explorer 11 on Windows 10 Version 1703 for x64-based Systems
Internet Explorer 10 on Windows Server 2012
Internet Explorer 11 on Windows 10 Version 1703 for 32-bit Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1511 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1511 for 32-bit Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems

MS17-JUN: Microsoft Internet Explorer Security Update - Registry Entry Not Set

Medium

Solution Details

To remedy this vulnerability, the system administrator will need to add a single specific registry entry for 32 bit systems and two registry entries for 64 bit systems.

For 32-bit and 64-bit systems:
Click Start, click Run, type regedt32 or type regedit, and then click OK.
In Registry Editor, locate the following registry folder:
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Internet Explorer\Main\FeatureControl
Right-click FeatureControl, point to New, and then click Key.
Type FEATURE_ENABLE_PRINT_INFO_DISCLOSURE_FIX, and then press Enter to name the new subkey.
Right-click FEATURE_ENABLE_PRINT_INFO_DISCLOSURE_FIX, point to New, and then click DWORD Value.
Type “iexplore.exe” (without quotes) for the new DWORD value.
Double-click the new DWORD value named iexplore.exe and change the Value data field to 1.
Click OK to close.

For 64-bit systems only:
Click Start, click Run, type regedt32 or type regedit, and then click OK.
In Registry Editor, locate the following registry folder:
HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\Internet Explorer\Main\FeatureControl
Right-click FeatureControl, point to New, and then click Key.
Type FEATURE_ENABLE_PRINT_INFO_DISCLOSURE_FIX, and then press Enter to name the new subkey.
Right-click FEATURE_ENABLE_PRINT_INFO_DISCLOSURE_FIX, point to New, and then click DWORD Value.
Type “iexplore.exe” (without quotes) for the new DWORD value.
Double-click the new DWORD value named iexplore.exe and change the Value data field to 1.
Click OK to close.

Vulnerability Details

The patch for MS17-JUN: Microsoft Internet Explorer Security Update is installed, however, the registry entry in order to be fully protected is not set.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS17-MAY: Microsoft .NET Security Update — Medium

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft has released a security update for Microsoft .NET Framework which includes fixes for the following vulnerabilities:

CVE-2017-0248 - .Net Security Feature Bypass Vulnerability

Affected Products:
Microsoft .NET Framework 4.5.2 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 4.5.2 on Windows RT 8.1
Microsoft .NET Framework 4.6.2 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 4.6.2 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.6.2 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.5.2 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.6/4.6.1 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 4.6 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 4.6.1 on Windows 10 Version 1511 for 32-bit Systems
Microsoft .NET Framework 4.5.2 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.6.2 on Windows 10 Version 1607 for x64-based Systems
Microsoft .NET Framework 4.6.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 4.6 on Windows 10 for 32-bit Systems
Microsoft .NET Framework 4.6/4.6.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.6.2 on Windows Server 2012 R2
Microsoft .NET Framework 3.5 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.6/4.6.1 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.6.2 on Windows Server 2012
Microsoft .NET Framework 4.6.2 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 4.5.2 on Windows Server 2012
Microsoft .NET Framework 3.5 on Windows 10 Version 1607 for x64-based Systems
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for Itanium-Based Systems Service Pack 2
Microsoft .NET Framework 3.5 on Windows 10 Version 1511 for 32-bit Systems
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 4.5.2 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 3.5 on Windows 10 for x64-based Systems
Microsoft .NET Framework 4.7 on Windows 10 Version 1703 for x64-based Systems
Microsoft .NET Framework 3.5.1 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.6.2 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.6 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.5.2 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.6/4.6.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.6.2 on Windows RT 8.1
Microsoft .NET Framework 4.7 on Windows 10 Version 1703 for 32-bit Systems
Microsoft .NET Framework 3.5 on Windows Server 2016
Microsoft .NET Framework 4.5.2 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.6/4.6.1 on Windows Server 2012
Microsoft .NET Framework 4.5.2 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows Server 2012 R2
Microsoft .NET Framework 4.6/4.6.1 on Windows 8.1 for x64-based systems

Microsoft .NET Framework 4.6.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.6.2 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Microsoft .NET Framework 4.5.2 on Windows Server 2012 R2
Microsoft .NET Framework 4.6.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 3.5.1 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 4.6/4.6.1 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 4.6.2 on Windows Server 2016 (Server Core installation)
Microsoft .NET Framework 4.6 on Windows 10 for x64-based Systems
Microsoft .NET Framework 4.6.2 on Windows Server 2016
Microsoft .NET Framework 4.6/4.6.1 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.6.1 on Windows 10 Version 1511 for x64-based Systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1703 for 32-bit Systems
Microsoft .NET Framework 3.5 on Windows Server 2012
Microsoft .NET Framework 3.5 on Windows 10 Version 1511 for x64-based Systems
Microsoft .NET Framework 3.5 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 3.5 on Windows Server 2016 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows 10 Version 1703 for x64-based Systems
Microsoft .NET Framework 3.5 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 4.6/4.6.1 on Windows Server 2012 R2
Microsoft .NET Framework 4.6/4.6.1 on Windows RT 8.1
Microsoft .NET Framework 3.5 on Windows 10 for 32-bit Systems
Microsoft .NET Framework 4.6/4.6.1 on Windows 8.1 for 32-bit systems

Solution Details

Microsoft has released a fix for this flaw in their May 2017 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

MS17-NOV: Microsoft Windows Security Update — Medium

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the following vulnerabilities:

CVE-2017-11788 - Windows Search Denial of Service Vulnerability
CVE-2017-11830 - Device Guard Security Feature Bypass Vulnerability
CVE-2017-11831 - Windows Information Disclosure Vulnerability
CVE-2017-11832 - Windows EOT Font Engine Information Disclosure Vulnerability
CVE-2017-11851 - Windows Kernel Information Disclosure Vulnerability
CVE-2017-11876 - Microsoft Project Server Elevation of Privilege Vulnerability
CVE-2017-11768 - Windows Media Player Information Disclosure Vulnerability
CVE-2017-11835 - Windows EOT Font Engine Information Disclosure Vulnerability
CVE-2017-11842 - Windows Kernel Information Disclosure Vulnerability
CVE-2017-11847 - Windows Kernel Elevation of Privilege Vulnerability
CVE-2017-11849 - Windows Kernel Information Disclosure Vulnerability
CVE-2017-11850 - Microsoft Graphics Component Information Disclosure Vulnerability
CVE-2017-11852 - Windows GDI Information Disclosure Vulnerability
CVE-2017-11853 - Windows Kernel Information Disclosure Vulnerability
CVE-2017-11880 - Windows Information Disclosure Vulnerability

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Microsoft SharePoint Enterprise Server 2016
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows 10 Version 1709 for 64-based Systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1

Windows 10 Version 1703 for x64-based Systems
Windows Server 2012 R2 (Server Core installation)
Windows 8.1 for x64-based systems
Windows Server 2012 R2

MS17-SEP: Microsoft Internet Explorer Security Update - Registry Entry Not Set

Medium

Solution Details

To remedy this vulnerability, the system administrator will need to add a single specific registry entry for 32 bit systems and two registry entries for 64 bit systems.

For 32-bit and 64-bit systems:

Click Start, click Run, type regedt32 or type regedit, and then click OK.
In Registry Editor, locate the following registry folder:
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Internet Explorer\Main\FeatureControl
Right-click FeatureControl, point to New, and then click Key.
Type FEATURE_ENABLE_PRINT_INFO_DISCLOSURE_FIX, and then press Enter to name the new subkey.
Right-click FEATURE_ENABLE_PRINT_INFO_DISCLOSURE_FIX, point to New, and then click DWORD Value.
Type “iexplore.exe” for the new DWORD value.
Double-click the new DWORD value named iexplore.exe and change the Value data field to 1.
Click OK to close.

For 64-bit systems only:
Click Start, click Run, type regedt32 or type regedit, and then click OK.
In Registry Editor, locate the following registry folder:
HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\Internet Explorer\Main\FeatureControl
Right-click FeatureControl, point to New, and then click Key.
Type FEATURE_ENABLE_PRINT_INFO_DISCLOSURE_FIX, and then press Enter to name the new subkey.
Right-click FEATURE_ENABLE_PRINT_INFO_DISCLOSURE_FIX, point to New, and then click DWORD Value.
Type “iexplore.exe” for the new DWORD value.
Double-click the new DWORD value named iexplore.exe and change the Value data field to 1.
Click OK to close.

Vulnerability Details

The patch for MS17-SEP: Microsoft Internet Explorer Security Update is installed, however, the registry entry in order to be fully protected is not set.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS18-JAN: Microsoft .NET Security Update

Medium

Solution Details

Microsoft has released a fix for this flaw in their January 2018 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

PLEASE NOTE: If this patch is not being offered by Windows Update, please verify that the following registry key exists and your antivirus software is up to date. Otherwise Windows Update will return no available patches while the system remains vulnerable.

Key="HKEY_LOCAL_MACHINE"Subkey="SOFTWARE\Microsoft\Windows\CurrentVersion\QualityCompa

Value Name="cadca5fe-87d3-4b96-b7fb-a231484277cc"
Type="REG_DWORD”
Data="0x00000000”

Microsoft has issued this guidance to all antivirus vendors, that they must set this registry key to signal to Windows Update that they are compatible with the latest 2018 updates. Please contact your antivirus vendor, or install Windows Defender on the affected system to resolve this condition and allow the system to continue receiving normal updates.

Vulnerability Details

Microsoft has released a security update for Microsoft .NET Framework which includes fixes for the following vulnerabilities:

CVE-2018-0784 - ASP.NET Core Elevation Of Privilege Vulnerability
CVE-2018-0786 - .NET Security Feature Bypass Vulnerability
CVE-2018-0764 - .NET and .NET Core Denial Of Service Vulnerability
CVE-2018-0785 - ASP.NET Core Cross Site Request Forgery Vulnerabilty

Affected Products:
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.5.2 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 4.5.2 on Windows RT 8.1
Microsoft .NET Framework 4.5.2 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.6 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 4.6.1 on Windows 10 Version 1511 for 32-bit Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7 on Windows Server 2012 R2
ASP.NET Core 2.0
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
.NET Core 1.1
Microsoft .NET Framework 4.5.2 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.6.2/4.7 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 4.6 on Windows 10 for 32-bit Systems
Microsoft .NET Framework 3.0 Service Pack 2 on Windows Server 2008 for Itanium-Based Systems Service Pack 2

Microsoft .NET Framework 3.5 on Windows Server 2012 (Server Core installation)
.NET Core 2.0
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7 on Windows Server 2012
Microsoft .NET Framework 4.5.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows Server 2012
Microsoft .NET Framework 3.5 on Windows 10 Version 1607 for x64-based Systems
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for Itanium-Based Systems Service Pack 2
Microsoft .NET Framework 4.7.1 on Windows 10 Version 1709 for 32-bit Systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1709 for 32-bit Systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1709 for x64-based Systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1511 for 32-bit Systems
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 4.5.2 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 3.5 on Windows 10 for x64-based Systems
Microsoft .NET Framework 4.7 on Windows 10 Version 1703 for x64-based Systems
Microsoft .NET Framework 3.5.1 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.7.1 on Windows Server, version 1709 (Server Core Installation)
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.5.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.6 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.5.2 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.7.1 on Windows 10 Version 1709 for x64-based Systems
Microsoft .NET Framework 4.7 on Windows 10 Version 1703 for 32-bit Systems
Microsoft .NET Framework 4.6.2/4.7 on Windows Server 2016 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows Server 2016
Microsoft .NET Framework 4.5.2 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.5.2 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows Server 2012 R2
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Microsoft .NET Framework 4.6.2/4.7 on Windows Server 2016
Microsoft .NET Framework 4.5.2 on Windows Server 2012 R2
Microsoft .NET Framework 3.5 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 3.5.1 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 3.0 Service Pack 2 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 4.6 on Windows 10 for x64-based Systems
.NET Core 1.0
Microsoft .NET Framework 3.5 on Windows Server, version 1709 (Server Core Installation)

MS18-JAN: Microsoft Windows Security Update (MELTDOWN) Medium

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft Windows which include fixes for the recently released CPU vulnerability known as MELTDOWN and the following vulnerabilities:

CVE-2017-5754 - Meltdown CPU Issue
CVE-2018-0818 - Scripting Engine Security Feature Bypass
CVE-2018-0746 - Windows Information Disclosure Vulnerability
CVE-2018-0747 - Windows Information Disclosure Vulnerability
CVE-2018-0748 - Windows Elevation of Privilege Vulnerability
CVE-2018-0751 - Windows Elevation of Privilege Vulnerability
CVE-2018-0752 - Windows Elevation of Privilege Vulnerability
CVE-2018-0753 - Windows IPSec Denial of Service Vulnerability
CVE-2018-0750 - Windows GDI Information Disclosure Vulnerability
CVE-2018-0788 - OpenType Font Driver Elevation of Privilege Vulnerability
CVE-2018-0741 - Microsoft Color Management Information Disclosure Vulnerability
CVE-2018-0743 - Windows Subsystem for Linux Elevation of Privilege Vulnerability
CVE-2018-0744 - Windows Elevation of Privilege Vulnerability
CVE-2018-0745 - Windows Information Disclosure Vulnerability
CVE-2018-0749 - SMB Server Elevation of Privilege Vulnerability
CVE-2018-0754 - OpenType Font Driver Information Disclosure Vulnerability

Meltdown (CVE-2017-5754) can be leveraged by a malicious program running on the local system to read memory from other processes, including the operating system. Additionally, it may be possible for a malicious program running inside a virtual machine to read memory from the host operating system. This can result in the disclosure of sensitive information which may lead to further compromise.

Affected Products:
Windows Server 2008 for x64-based Systems Service Pack 2 (Server Core installation)
Windows 10 Version 1511 for x64-based Systems
Windows 10 Version 1607 for 32-bit Systems
Windows 10 for 32-bit Systems
Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1
Windows Server 2008 for 32-bit Systems Service Pack 2
Windows Server 2012 (Server Core installation)

Windows 10 Version 1607 for x64-based Systems
Windows Server 2008 for Itanium-Based Systems Service Pack 2
Windows Server 2016 (Server Core installation)
Windows 10 Version 1511 for 32-bit Systems
Windows 10 Version 1709 for 32-bit Systems
Windows Server 2012
Windows 7 for x64-based Systems Service Pack 1
Windows Server 2008 for 32-bit Systems Service Pack 2 (Server Core installation)
Windows 7 for 32-bit Systems Service Pack 1
Windows Server 2008 R2 for x64-based Systems Service Pack 1
Windows Server 2008 for x64-based Systems Service Pack 2
Windows 10 Version 1703 for 32-bit Systems
Windows 10 for x64-based Systems
Windows 10 Version 1703 for x64-based Systems
Windows Server 2012 R2 (Server Core installation)
Windows 10 Version 1709 for x64-based Systems
Windows 8.1 for x64-based systems
Windows Server 2012 R2
Windows Server 2016
Windows 8.1 for 32-bit systems
Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Windows Server, version 1709 (Server Core Installation)

Solution Details

Microsoft has released a fix for this flaw in their January 2018 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

PLEASE NOTE: If this patch is not being offered by Windows Update please verify that the following registry key exists and your antivirus software is up to date. Otherwise Windows Update will return no available patches while the system remains vulnerable.

Key="HKEY_LOCAL_MACHINE"Subkey="SOFTWARE\Microsoft\Windows\CurrentVersion\QualityCompa

Value Name="cadca5fe-87d3-4b96-b7fb-a231484277cc"
Type="REG_DWORD”
Data="0x00000000”

Microsoft has issued this guidance to all antivirus vendors, that they must set this registry key to signal to Windows Update that they are compatible with the latest 2018 updates. Please contact your antivirus vendor, or install Windows Defender on the affected system to resolve this condition and allow the system to continue receiving normal updates.

MS18-JAN: Microsoft Windows Security Update - Registry Entry Not Set	Medium

Solution Details

The MS18-JAN patch has already been applied. For full remediation of these vulnerabilities, three registry entries need to be created and set to a specific value depending on which processor is used for this asset.

For Intel processors, the following key and values need to be set:

Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management
Value: FeatureSettingsOverride = 0
Value Type: DWORD (decimal value)

For AMD processors, the following key and values need to be set:

Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management
Value: FeatureSettingsOverride = 64
Value Type: DWORD (decimal value)

For both Intel and AMD processors, the following key and values need to be set:

Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management
Value: FeatureSettingsOverrideMask = 3
Value Type: DWORD (decimal value)

If Microsoft Hyper-V is enabled, both Intel and AMD based Windows Servers also require the following key to be set, in addition to the above two keys for the respective CPU:

Key: HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Virtualization
Value: MinVmVersionForCpuBasedMitigations = 1.0
Value Type: String Value (REG_SZ)

Example:
For an Intel processor, if the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management doesn't exist, it will first need to be created. After creating it, you'll need to create a new value under this new registry key with the name "FeatureSettingsOverride" (without quotes) that is of type DWORD and set to 0 decimal value.

If the registry key and "FeatureSettingsOverride" already exists, verify that the value is set to 0 decimal value.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Microsoft is aware of a new publicly disclosed class of vulnerabilities referred to as "speculative execution side-channel attacks" that affect many modern processors and operating systems including Intel, AMD, and ARM.

The Microsoft patch for this vulnerability has already been installed, however, the scanner has detected the registry changes required to fully remediate these vulnerabilities have not been set.
Impact:
An attacker who successfully exploited these vulnerabilities may be able to read privileged data across trust boundaries. In shared resource environments (such as exists in some cloud services configurations), these vulnerabilities could allow one virtual machine to improperly access information from another. In non-browsing scenarios on standalone systems, an attacker would need prior access to the system or an ability to run code on the system to leverage these vulnerabilities.

CVSS Base Score: 4.7

MS18-JUL: Microsoft .NET Security Update

Medium

Vulnerability Details

Microsoft has released a security update for Microsoft .NET Framework which includes fixes for the following vulnerabilities:

CVE-2018-8202 - .NET Framework Elevation of Privilege Vulnerability
CVE-2018-8356 - .NET Framework Security Feature Bypass Vulnerability
CVE-2018-8260 - .NET Framework Remote Code Execution Vulnerability
CVE-2018-8284 - .NET Framework Remote Code Injection Vulnerability
CVE-2018-8171 - ASP.NET Security Feature Bypass Vulnerability

Affected Products:
ASP.NET Core 1.1
Microsoft .NET Framework 4.6/4.6.1/4.6.2 on Windows 10 for 32-bit Systems
ASP.NET Web Pages 3.2.3 on Microsoft Visual Studio 2013 Update 5
Microsoft .NET Framework 4.5.2 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 4.5.2 on Windows RT 8.1
Microsoft .NET Framework 4.7.2 on Windows Server 2016
Microsoft .NET Framework 4.7.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1803 for 32-bit Systems
Microsoft .NET Framework 4.7.2 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.6.2/4.7/4.7.1/4.7.2 on Windows Server 2016
Microsoft .NET Framework 4.5.2 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1703 for x64-based Systems
Microsoft .NET Framework 4.7.2 on Windows Server, version 1803 (Server Core Installation)
Microsoft .NET Framework 4.6 on Windows Server 2008 for x64-based Systems Service Pack 2
ASP.NET Core 2.0
Microsoft .NET Framework 4.7.1/4.7.2 on Windows 10 Version 1709 for x64-based Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
.NET Core 1.1
Microsoft .NET Framework 4.5.2 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1703 for 32-bit Systems
Microsoft .NET Framework 3.5 on Windows Server, version 1803 (Server Core Installation)
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows 7 for x64-based Systems Service Pack 1

ASP.NET MVC 5.2 on Microsoft Visual Studio 2015 Update 3
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 4.7.2 on Windows Server 2016 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows 10 Version 1803 for x64-based Systems
Microsoft .NET Framework 4.7.2 on Windows Server 2012
Microsoft .NET Framework 3.0 Service Pack 2 on Windows Server 2008 for Itanium-Based Systems Service Pack 2
Microsoft .NET Framework 4.7.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.6/4.6.1/4.6.2 on Windows 10 for x64-based Systems
.NET Core 2.0
Microsoft .NET Framework 4.7.1/4.7.2 on Windows Server, version 1709 (Server Core Installation)
Microsoft .NET Framework 4.5.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows Server 2012
Microsoft .NET Framework 3.5 on Windows 10 Version 1607 for x64-based Systems
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for Itanium-Based Systems Service Pack 2
Microsoft .NET Framework 3.5 on Windows 10 Version 1709 for 32-bit Systems
Microsoft .NET Framework 4.7/4.7.1/4.7.2 on Windows 10 Version 1703 for x64-based Systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1709 for x64-based Systems
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 4.5.2 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1607 for x64-based Systems
Microsoft .NET Framework 3.5.1 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows 10 for x64-based Systems
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.5.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.7/4.7.1/4.7.2 on Windows 10 Version 1703 for 32-bit Systems
ASP.NET Web Pages 3.2.3 on Microsoft Visual Studio 2015 Update 3
Microsoft .NET Framework 4.6 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1709 for x64-based Systems
Microsoft .NET Framework 4.5.2 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.7.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
.NET Framework 4.7.2 Developer Pack
Microsoft .NET Framework 3.5 on Windows Server 2016
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows RT 8.1
Microsoft .NET Framework 4.5.2 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.6.2/4.7/4.7.1/4.7.2 on Windows 10 Version 1607 for x64-based Systems
Microsoft .NET Framework 4.5.2 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows Server 2012 R2
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1709 for 32-bit Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for Itanium-Based Systems Service Pack 1

Microsoft .NET Framework 4.5.2 on Windows Server 2012 R2
Microsoft .NET Framework 4.7.2 on Windows Server 2012 R2
Microsoft .NET Framework 4.7.2 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 4.7.2 on Windows Server, version 1709 (Server Core Installation)
Microsoft .NET Framework 3.5 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 3.5.1 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 4.7.2 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 3.0 Service Pack 2 on Windows Server 2008 for x64-based Systems Service Pack 2
ASP.NET Core 1.0
.NET Core 1.0
Microsoft .NET Framework 3.5 on Windows Server, version 1709 (Server Core Installation)

Microsoft .NET Framework 3.0 Service Pack 2 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.7.1/4.7.2 on Windows 10 Version 1709 for 32-bit Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1703 for 32-bit Systems
Microsoft .NET Framework 4.6.2/4.7/4.7.1/4.7.2 on Windows Server 2016 (Server Core installation)
Microsoft .NET Framework 4.7.2 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows Server 2012
Microsoft .NET Framework 4.6.2/4.7/4.7.1/4.7.2 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 3.5 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows Server 2012
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows Server 2012 R2
Microsoft .NET Framework 4.7.2 on Windows RT 8.1
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows Server 2016 (Server Core installation)
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1803 for x64-based Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows 10 Version 1703 for x64-based Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.1/4.7.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows 10 for 32-bit Systems
Microsoft .NET Framework 4.7.2 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1803 for 32-bit Systems

Solution Details

Microsoft has released a fix for this flaw in their July 2018 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS18-MAY: Microsoft .NET Security Update | Medium

Vulnerability Details

Microsoft has released a security update for Microsoft .NET Framework which includes fixes for the following vulnerabilities:

CVE-2018-1039 - .NET Framework Device Guard Security Feature Bypass Vulnerability
CVE-2018-0765 - .NET and .NET Core Denial of Service Vulnerability

Affected Products:
Microsoft .NET Framework 4.6/4.6.1/4.6.2 on Windows 10 for 32-bit Systems
Microsoft .NET Framework 4.7/4.7.1 on Windows 10 Version 1703 for 32-bit Systems
Microsoft .NET Framework 4.6.2/4.7/4.7.1 on Windows Server 2016 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 4.5.2 on Windows RT 8.1
Microsoft .NET Framework 3.5 on Windows 10 Version 1803 for 32-bit Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.6.2/4.7/4.7.1 on Windows Server 2016
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1 on Windows Server 2012
Microsoft .NET Framework 4.5.2 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.7.2 on Windows Server, version 1803 (Server Core Installation)
Microsoft .NET Framework 4.6 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows Server, version 1803 (Server Core Installation)
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1 on Windows 7 for 32-bit Systems Service Pack 1
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1803 for x64-based Systems
Microsoft .NET Framework 3.0 Service Pack 2 on Windows Server 2008 for Itanium-Based Systems Service Pack 2
Microsoft .NET Framework 3.5 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.6/4.6.1/4.6.2 on Windows 10 for x64-based Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1 on Windows 8.1 for 32-bit systems
.NET Core 2.0
Microsoft .NET Framework 4.5.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)

MS18-NOV: Microsoft Internet Explorer Security Update — Medium

Solution Details

Microsoft has released a fix for this flaw in their November 2018 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2018-8552 - Windows Scripting Engine Memory Corruption Vulnerability
CVE-2018-8570 - Internet Explorer Memory Corruption Vulnerability

Affected Products:
Internet Explorer 10 on Windows Server 2012
Internet Explorer 11 on Windows 10 Version 1703 for x64-based Systems
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1703 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for x64-based systems

Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems
Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems

MS18-NOV: Microsoft Windows Security Update - Registry Entry Not Set

Medium

Solution Details

The MS18-NOV patch has already been applied. For full remediation of this vulnerability, three registry entries need to be created and set to a specific value depending on which processor is used for this asset.

The registry values are different depending on processor architecture.

For Intel processors, the following key and values need to be set:
Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management
Value: FeatureSettingsOverride = 8
Value Type: DWORD (decimal value)

For AMD processors, the following key and values need to be set:
Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management
Value: FeatureSettingsOverride = 72
Value Type: DWORD (decimal value)

For both Intel and AMD processors, the following key and values need to be set:
Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory

Management
Value: FeatureSettingsOverrideMask = 3
Value Type: DWORD (decimal value)

If Microsoft Hyper-V is enabled, both Intel and AMD based Windows Servers also require the following key to be set, in addition to the above two keys for the respective CPU:
Key: HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Virtualization
Value: MinVmVersionForCpuBasedMitigations = 1.0
Value Type: String Value (REG_SZ)

Example:
For an Intel processor, if the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management doesn't exist, it will first need to be created. After creating it, you'll need to create a new value under this new registry key with the name "FeatureSettingsOverride" (without quotes) that is of type DWORD and set to 8 decimal value.

If the registry key and "FeatureSettingsOverride" already exists, verify that the value is set to 8 decimal value.

Vulnerability Details

On January 3, 2018, Microsoft released an advisory and security updates related to a newly-discovered class of hardware vulnerabilities (known as Spectre and Meltdown) involving speculative execution side channels. A new subclass of speculative execution side channel vulnerabilities known as Speculative Store Bypass (SSB) has been announced and assigned CVE-2018-3639.

The Microsoft patch for this vulnerability has already been installed, however, the scanner has detected the registry changes required to fully remediate this vulnerability have not been set.
Impact:
An attacker who has successfully exploited this vulnerability may be able to read privileged data across trust boundaries.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS19-JAN: Microsoft Internet Explorer Security Update — Medium

Vulnerability Details

Microsoft has released cumulative security updates for Internet Explorer which include fixes for the following vulnerabilities:

CVE-2019-0541 - MSHTML Engine Remote Code Execution Vulnerability

Affected Products:
Microsoft Office 2010 Service Pack 2 (64-bit editions)
Internet Explorer 11 on Windows 10 Version 1703 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1703 for 32-bit Systems
Microsoft Office 2016 (32-bit edition)
Internet Explorer 11 on Windows 8.1 for x64-based systems
Internet Explorer 11 on Windows 10 Version 1709 for 32-bit Systems
Internet Explorer 11 on Windows 10 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for 32-bit Systems
Microsoft Office 2016 (64-bit edition)
Internet Explorer 11 on Windows 10 Version 1709 for ARM64-based Systems
Internet Explorer 11 on Windows 10 Version 1803 for ARM64-based Systems
Internet Explorer 9 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft Office 2010 Service Pack 2 (32-bit editions)
Internet Explorer 11 on Windows 10 Version 1709 for x64-based Systems
Microsoft Excel Viewer 2007 Service Pack 3
Microsoft Office Word Viewer
Internet Explorer 11 on Windows Server 2019
Internet Explorer 11 on Windows 10 Version 1809 for ARM64-based Systems
Microsoft Office 2019 for 32-bit editions
Office 365 ProPlus for 64-bit Systems
Internet Explorer 11 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Internet Explorer 11 on Windows Server 2016
Internet Explorer 11 on Windows 10 Version 1803 for 32-bit Systems
Internet Explorer 11 on Windows 10 Version 1607 for x64-based Systems
Microsoft Office 2013 Service Pack 1 (32-bit editions)
Microsoft Office 2019 for 64-bit editions
Internet Explorer 10 on Windows Server 2012
Internet Explorer 11 on Windows 7 for 32-bit Systems Service Pack 1
Internet Explorer 11 on Windows 10 Version 1809 for x64-based Systems
Microsoft Office 2013 Service Pack 1 (64-bit editions)
Internet Explorer 11 on Windows RT 8.1
Internet Explorer 11 on Windows 10 for x64-based Systems
Internet Explorer 11 on Windows 8.1 for 32-bit systems
Internet Explorer 11 on Windows Server 2012 R2
Microsoft Office 2013 RT Service Pack 1
Internet Explorer 11 on Windows 10 Version 1803 for x64-based Systems
Internet Explorer 11 on Windows 10 Version 1809 for 32-bit Systems

Internet Explorer 11 on Windows 7 for x64-based Systems Service Pack 1
Office 365 ProPlus for 32-bit Systems
Internet Explorer 9 on Windows Server 2008 for x64-based Systems Service Pack 2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Microsoft has released a fix for this flaw in their January 2019 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

MS19-MAY: Microsoft .NET Security Update — Medium

Solution Details

Microsoft has released a fix for this flaw in their May 2019 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released a security update for Microsoft .NET Framework which includes fixes for the following vulnerabilities:

CVE-2019-0980 - .Net Framework and .Net Core Denial of Service Vulnerability
CVE-2019-0981 - .Net Framework and .Net Core Denial of Service Vulnerability
CVE-2019-0820 - .NET Framework and .NET Core Denial of Service Vulnerability
CVE-2019-0864 - .NET Framework Denial of Service Vulnerability

Affected Products:
Microsoft .NET Framework 4.8 on Windows 10 Version 1709 for 32-bit Systems
Microsoft .NET Framework 4.6.2 on Windows 10 for 32-bit Systems
Microsoft .NET Framework 4.7.2 on Windows Server 2019 (Server Core installation)
Microsoft .NET Framework 4.8 on Windows 10 Version 1703 for x64-based Systems
Microsoft .NET Framework 4.8 on Windows 10 Version 1703 for 32-bit Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1
Microsoft .NET Framework 4.5.2 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 4.5.2 on Windows RT 8.1
Microsoft .NET Framework 3.5 on Windows 10 Version 1803 for 32-bit Systems
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1809 for x64-based Systems
Microsoft .NET Framework 4.6.2/4.7/4.7.1/4.7.2 on Windows Server 2016
Microsoft .NET Framework 4.5.2 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.8 on Windows 10 Version 1809 for 32-bit Systems
Microsoft .NET Framework 4.7.2 on Windows Server, version 1803 (Server Core Installation)
Microsoft .NET Framework 4.6 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 4.7.1/4.7.2 on Windows 10 Version 1709 for x64-based Systems
.NET Core 1.1
Microsoft .NET Framework 4.5.2 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.2 on Windows RT 8.1
Microsoft .NET Framework 4.8 on Windows Server 2012 R2 (Server Core installation)

Microsoft .NET Framework 4.7.2 on Windows 10 Version 1809 for 32-bit Systems
Microsoft .NET Framework 3.5 on Windows Server, version 1803 (Server Core Installation)
Microsoft .NET Framework 4.7.2 on Windows 10 Version 1803 for ARM64-based Systems
Microsoft .NET Framework 4.8 on Windows Server 2012
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.2 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.6.2 on Windows 10 for x64-based Systems
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.8 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 4.5.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 4.8 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 3.5 on Windows 10 Version 1803 for x64-based Systems
Microsoft .NET Framework 3.0 Service Pack 2 on Windows Server 2008 for Itanium-Based Systems Service Pack 2
Microsoft .NET Framework 3.5 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.8 on Windows 10 Version 1903 for x64-based Systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1903 for 32-bit Systems
Microsoft .NET Framework 4.5.2 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.5.2 on Windows Server 2012
Microsoft .NET Framework 3.5 on Windows 10 Version 1607 for x64-based Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 3.5 on Windows 10 Version 1903 for x64-based Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.2 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for Itanium-Based Systems Service Pack 2
Microsoft .NET Framework 3.5 on Windows 10 Version 1709 for 32-bit Systems

MS19-MAY: Microsoft Windows Security Update (ZombieLoad) - Registry Entry Not Set

Medium

Solution Details

The MS19-MAY patch has already been applied. For full remediation of this vulnerability, multiple registry entries need to be created and set to a specific value depending if the asset is a client or server machine and if hyper-threading is enabled or not. Note, these changes only need to be made for hosts using a 64 bit Intel processor. AMD and 32 bit Intel processors aren't vulnerable.

With hyper-threading enabled: (for both servers and clients)
Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management
Value: FeatureSettingsOverride = 72
Value Type: DWORD (decimal value)

With hyper-threading disabled: (for both servers and clients)
Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management
Value: FeatureSettingsOverride = 8264
Value Type: DWORD (decimal value)

This value is the same regardless of hyper-threading or type of machine (servers or clients)
Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management
Value: FeatureSettingsOverrideMask = 3
Value Type: DWORD (decimal value)

This key/value is only required for machines with Microsoft Hyper-V enabled:
Key: HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Virtualization
Value: MinVmVersionForCpuBasedMitigations = 1.0
Value Type: String Value (REG_SZ)

Example:
For a host with hyper-threading disabled, if the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Memory Management doesn't exist, it will first need to be created. After creating it, you'll need to create a new value under this new registry key with the name "FeatureSettingsOverride" (without quotes) that is of type DWORD and set to 8264 decimal value.

If the registry key and "FeatureSettingsOverride" already exists and hyper-threading is disabled, verify that the value is set to 8264 decimal value.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

On January 3, 2018, Microsoft released an advisory and security updates related to a newly-discovered class of hardware vulnerabilities (known as Spectre and Meltdown) involving speculative execution side channels. A new subclass of speculative execution side channel vulnerabilities known as Microarchitectural Data Sampling has been announced.

The Microsoft patch for this vulnerability has already been installed, however, the scanner has detected the registry changes required to fully remediate this vulnerability have not been set.
Impact:
An attacker who has successfully exploited this vulnerability may be able to read privileged data across trust boundaries.

CVSS Base Score: 4.7

CVSS Vector: AV:L/AC:M/Au:N/C:C/I:N/A:N

MS19-NOV: Microsoft Windows Security Update - Registry Entry Not Set

Medium

Solution Details

The MS19-NOV patch has already been applied. By default, all Windows client operating systems and Windows Server 2019 have the mitigation for this vulnerability enabled. However, the earlier Windows Server versions do not have this mitigation enabled by default. In order to fully remediate this vulnerability on the earlier versions of Windows server, a registry entry needs to be added. Additionally, this vulnerability only affects Intel processors.

Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\Kernel
Value: DisableTsx = 1
Value Type: DWORD (Decimal value)

Vulnerability Details

An information disclosure vulnerability exists when the Windows kernel improperly handles objects in memory. To exploit this vulnerability, an attacker would have to log on to an affected system and run a specially crafted application. The vulnerability would not allow an attacker to execute code or to elevate user rights directly, but it could be used to obtain information that could be used to try to further compromise the affected system.

The Microsoft patch for this vulnerability has already been installed, however, the scanner has detected the registry changes required to fully remediate this vulnerability have not been set.

Impact:
An attacker who successfully exploited this vulnerability could obtain information to further compromise the user’s system.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS21-JAN: Microsoft SQL Server Security Update — Medium

Solution Details

Microsoft has released a fix for this flaw in their January 2021 Security Update. Please download and install the patch from the Microsoft Update Catalog.

Vulnerability Details

Microsoft has released cumulative security updates for Microsoft SQL Server which include fixes for the following vulnerabilities:

CVE-2021-1636 - Microsoft SQL Elevation of Privilege Vulnerability

Affected Products:
Microsoft SQL Server 2016 for x64-based Systems Service Pack 2 (GDR)
Microsoft SQL Server 2012 for x64-based Systems Service Pack 4 (QFE)
Microsoft SQL Server 2017 for x64-based Systems (CU 22)
Microsoft SQL Server 2014 Service Pack 3 for x64-based Systems (GDR)
Microsoft SQL Server 2014 Service Pack 3 for 32-bit Systems (CU 4)
Microsoft SQL Server 2012 for 32-bit Systems Service Pack 4 (QFE)
Microsoft SQL Server 2017 for x64-based Systems (GDR)

Microsoft SQL Server 2014 Service Pack 3 for x64-based Systems (CU 4)
Microsoft SQL Server 2019 for x64-based Systems (GDR)
Microsoft SQL Server 2016 Service Pack 2 for x64-based Systems (CU 15)
Microsoft SQL Server 2019 for x64-based Systems (CU 8)
Microsoft SQL Server 2014 Service Pack 3 for 32-bit Systems (GDR)

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

NetBIOS Shares Accessible — Medium

Solution Details

Review the shares that are listed in the vulnerability data section. Disable any shares that are unnecessary.

On Microsoft Windows operating systems, the shares on the local or remote machines can be viewed by using the "Shared Folders" Snap-in of the Microsoft Management Console (MMC). There are three shares that are present by default and cannot be modified: ADMIN$, C$, IPC$. All other shares should be listed and modifiable through this Snap-in.

For Samba installations, modify the smb.conf file so that it either specifies the users who are allowed to access the host in the 'valid users' field, or so that it specifies the allowed hosts in the 'hosts allow' field. The smb.conf file is typically found in the /etc/samba/ directory but this location varies between system distributions.

Note: Specific UNIX distributions may require different steps. Please consult the Samba documentation for further details.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This host revealed one or more NetBIOS shares that did not require any authentication to access. An attacker can read data from these NetBIOS shares or potentially trojan files in an effort to compromise this host.

CVSS Base Score: 7.5

CVSS Vector: AV:N/AC:L/Au:N/C:P/I:P/A:P

OpenSSH Account Enumeration Vulnerability — Medium

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

Vulnerability Details

OpenSSH, when using OPIE (One-Time Passwords in Everything) for PAM, allows remote attackers to determine the existence of certain user accounts, which displays a different response if the user account exists and is configured to use one-time passwords (OTP), a similar issue to CVE-2007-2243.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

CVSS Vector: AV:N/AC:M/Au:N/C:P/I:N/A:N

Type	Reference
CVE	https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2007-2768

OpenSSH 'auth-gss2.c' User Detection Vulnerability — Medium

Vulnerability Details

Remotely observable behaviour in auth-gss2.c in OpenSSH through 7.8 could be used by remote attackers to detect existence of users on a target system when GSS2 is in use. NOTE: the discoverer states 'We understand that the OpenSSH developers do not want to treat such a username enumeration (or "oracle") as a vulnerability.'
Impact:
An attacker may leverage this issue to harvest valid user accounts, which may aid in brute-force attacks.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

CVSS Base Score: 5.3

OpenSSH 'before 7.6' 'process_open function in sftp-server.c' subcomponent Does not Properly Prevent Write Operations in Readonly Mode Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The process_open function in sftp-server.c in OpenSSH before 7.6 does not properly prevent write operations in readonly mode, which allows attackers to create zero-length files.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5

OpenSSH BLOWFISH Hashing User Enumeration — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

sshd in OpenSSH before 7.3, when SHA256 or SHA512 are used for user password hashing, uses BLOWFISH hashing on a static password when the username does not exist, which allows remote attackers to enumerate users by leveraging the timing difference between responses when a large password is provided.

CVSS Base Score: 4.3

OpenSSH Heap-Based Buffer Overflow Vulnerability — Medium

Vulnerability Details

The (1) roaming_read and (2) roaming_write functions in roaming_common.c in the client in OpenSSH 5.x, 6.x, and 7.x before 7.1p2, when certain proxy and forward options are enabled, do not properly maintain connection file descriptors, which allows remote servers to cause a denial of service (heap-based buffer overflow) or possibly have unspecified other impact by requesting many forwardings.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

OpenSSH Information Disclosure Vulnerability — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

Vulnerability Details

The resend_bytes function in roaming_common.c in the client in OpenSSH 5.x, 6.x, and 7.x before 7.1p2 allows remote servers to obtain sensitive information from process memory by requesting transmission of an entire buffer, as demonstrated by reading a private key.

OpenSSH kex.c and packet.c NULL Pointer Dereference Denial of Service

Medium

Vulnerability Details

sshd in OpenSSH before 7.4 allows remote attackers to cause a denial of service (NULL pointer dereference and daemon crash) via an out-of-sequence NEWKEYS message, as demonstrated by Honggfuzz, related to kex.c and packet.c.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

CVSS Base Score: 5

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:P

OpenSSH Missing Character Man-in-The-Middle Attack Vulnerability — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References for a link to upgrade to the most recent stable version of OpenSSH.

Vulnerability Details

An issue was discovered in OpenSSH 7.9. Due to missing character encoding in the progress display, a malicious server (or Man-in-The-Middle attacker) can employ crafted object names to manipulate the client output, e.g., by using ANSI control codes to hide additional files being transferred. This affects refresh_progress_meter() in progressmeter.c.
Impact:
Successfully exploiting this issue allows attackers to perform man-in-the-middle attacks and bypass certain security restrictions.

CVSS Base Score: 4

CVSS Vector: AV:N/AC:H/Au:N/C:P/I:P/A:N

OpenSSH monitor.c 'mm_answer_pam_free_ctx' Use-After-Free Vulnerability

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Use-after-free vulnerability in the mm_answer_pam_free_ctx function in monitor.c in sshd in OpenSSH before 7.0 on non-OpenBSD platforms might allow local users to gain privileges by leveraging control of the sshd uid to send an unexpectedly early MONITOR_REQ_PAM_FREE_CTX request.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.9

OpenSSH 'Observable Discrepancy' Man-in-the-Middle Vulnerability — Medium

Solution Details

Update to the most recent stable version of OpenSSH.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

The client side in OpenSSH has an Observable Discrepancy leading to an information leak in the algorithm negotiation. This allows man-in-the-middle attackers to target initial connection attempts (where no host key for the server has been cached by the client).
Impact:
An attacker could leverage this vulnerability to gain access to sensitive information without proper authorization.

CVSS Base Score: 4.3

CVSS Vector: AV:N/AC:M/Au:N/C:P/I:N/A:N

Type	Reference
CVE	https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2020-14145

OpenSSH Privilege Escalation Vulnerability — Medium

Vulnerability Details

sshd in OpenSSH 6.2 through 8.x before 8.8, when certain non-default configurations are used, allows privilege escalation because supplemental groups are not initialized as expected. Helper programs for AuthorizedKeysCommand and AuthorizedPrincipalsCommand may run with privileges associated with group memberships of the sshd process, if the configuration specifies running the command as a different user.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please upgrade to the latest version.

CVSS Base Score: 4.4

CVSS Vector: AV:L/AC:M/Au:N/C:P/I:P/A:P

OpenSSH Privilege Escalation Vulnerability — Medium

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

Vulnerability Details

sshd in OpenSSH before 7.4, when privilege separation is not used, creates forwarded Unix-domain sockets as root, which might allow local users to gain privileges via unspecified vectors, related to serverloop.c.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH Remote Command Injection Vulnerability — Medium

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

Vulnerability Details

Multiple CRLF injection vulnerabilities in session.c in sshd in OpenSSH before 7.2p2 allow remote authenticated users to bypass intended shell-command restrictions via crafted X11 forwarding data, related to the (1) do_authenticated1 and (2) session_x11_req functions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH 'scp' Command Evaluation Vulnerability — Medium

Solution Details

Use of rsync in the place of scp for better security. If scp is required, please ensure it is updated with the latest patches and fixes from the vendor.

Vulnerability Details

scp in OpenSSH through 8.3p1 allows command injection in scp.c remote function, as demonstrated by backtick characters in the destination argument.
Impact:
An attacker can exploit this vulnerability to cause a denial-of-service condition, denying service to legitimate users or obtain a reverse shell.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.8

CVSS Vector: AV:L/AC:L/PR:N/UI:R/S:U/C:H/I:H/A:H

Type	Reference
CVE	https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2020-15778

OpenSSH scp Server Man-in-The-Middle Attack Vulnerability — Medium

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of OpenSSH.

Vulnerability Details

An issue was discovered in OpenSSH 7.9. Due to the scp implementation being derived from 1983 rcp, the server chooses which files/directories are sent to the client. However, the scp client only performs cursory validation of the object name returned (only directory traversal attacks are prevented). A malicious scp server (or Man-in-The-Middle attacker) can overwrite arbitrary files in the scp client target directory. If recursive operation (-r) is performed, the server can manipulate subdirectories as well (for example, to overwrite the .ssh/authorized_keys file).
Impact:
Successfully exploiting this issue allows attackers to perform man-in-the-middle attacks and bypass certain security restrictions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5.8

OpenSSH Sensitive Data Exposure Vulnerability — Medium

Vulnerability Details

OpenSSH through 8.7 allows remote attackers, who have a suspicion that a certain combination of username and public key is known to an SSH server, to test whether this suspicion is correct. This occurs because a challenge is sent only when that combination could be valid for a login session.

Solution Details

Please upgrade to the latest version.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5.3

OpenSSH 'ssh_packet_read_poll2' Function Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The ssh_packet_read_poll2 function in packet.c in OpenSSH before 7.1p2 allows remote attackers to cause a denial of service (out-of-bounds read and application crash) via crafted network traffic.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH 'stderr' Man-in-The-Middle Attack Vulnerability — Medium

Solution Details

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

In OpenSSH 7.9, due to accepting and displaying arbitrary stderr output from the server, a malicious server (or Man-in-The-Middle attacker) can manipulate the client output, for example to use ANSI control codes to hide additional files being transferred.
Impact:
Successfully exploiting this issue allows attackers to perform man-in-the-middle attacks and bypass certain security restrictions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH User Enumeration Vulnerability — Medium

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

Vulnerability Details

OpenSSH through 7.7 is prone to a user enumeration vulnerability due to not delaying bailout for an invalid authenticating user until after the packet containing the request has been fully parsed, related to auth2-gss.c, auth2-hostbased.c, and auth2-pubkey.c.

Impact:
A remote user can determine valid usernames on the target system.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH 'x11_open_helper' Function Access Restriction Bypass — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The x11_open_helper function in channels.c in ssh in OpenSSH before 6.9, when ForwardX11Trusted mode is not used, lacks a check of the refusal deadline for X connections, which makes it easier for remote attackers to bypass intended access restrictions via a connection outside of the permitted time window.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSL Deprecated Function 'RAND_pseudo_bytes' Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The openssl_random_pseudo_bytes function in ext/openssl/openssl.c in PHP before 5.4.44, 5.5.x before 5.5.28, and 5.6.x before 5.6.12 incorrectly relies on the deprecated RAND_pseudo_bytes function, which makes it easier for remote attackers to defeat cryptographic protection mechanisms via unspecified vectors.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 5.6.x and 7.x 'gdImageRotateInterpolated' Function Denial of Service — Medium

Vulnerability Details

The gdImageRotateInterpolated function in ext/gd/libgd/gd_interpolation.c in PHP before 5.5.31, 5.6.x before 5.6.17, and 7.x before 7.0.2 allows remote attackers to obtain sensitive information or cause a denial of service (out-of-bounds read and application crash) via a large bgd_color argument to the imagerotate function.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP before 5.5.31, 5.6.x before 5.6.17, and 7.x before 7.0.2 Remote Denial of Service Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

sapi/fpm/fpm/fpm_log.c in PHP before 5.5.31, 5.6.x before 5.6.17, and 7.x before 7.0.2 misinterprets the semantics of the snprintf return value, which allows attackers to obtain sensitive information from process memory or cause a denial of service (out-of-bounds read and buffer overflow) via a long string, as demonstrated by a long URI in a configuration with custom REQUEST_URI logging.

CVSS Base Score: 9.1

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:N/A:H

PHP before 5.5.32, 5.6.x before 5.6.18, and 7.x before 7.0.3: Metadata can be set by an attacker

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

In PHP before 5.5.32, 5.6.x before 5.6.18, and 7.x before 7.0.3, all of the return values of stream_get_meta_data can be controlled if the input can be controlled (e.g., during file uploads). For example, a "$uri = stream_get_meta_data(fopen($file, "r"))['uri']" call mishandles the case where $file is data:text/plain;uri=eviluri, -- in other words, metadata can be set by an attacker.

PHP 'before 5.6.32, 7.x before 7.0.25, 7.1.x before 7.1.11' Interpreter Information Leak Vulnerability

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

In PHP before 5.6.32, 7.x before 7.0.25, and 7.1.x before 7.1.11, an error in the date extension's timelib_meridian handling of 'front of' and 'back of' directives could be used by attackers able to supply date strings to leak information from the interpreter, related to ext/date/lib/parse_date.c out-of-bounds reads affecting the php_parse_date function. NOTE: this is a different issue than CVE-2017-11145.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'Bucket Brigade' Vulnerability — Medium

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

The Apache2 component in PHP before 5.6.38, 7.0.x before 7.0.32, 7.1.x before 7.1.22, and 7.2.x before 7.2.10 allows XSS via the body of a "Transfer-Encoding: chunked" request, because the bucket brigade is mishandled in the php_handler function in sapi/apache2handler/sapi_apache2.c.
Impact:
A cross-site scripting attack could be launched via the body of a "Transfer-Encoding: chunked" request.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

PHP bz2.c 'bzread' Denial of Service — Medium

Vulnerability Details

The bzread function in ext/bz2/bz2.c in PHP before 5.5.38, 5.6.x before 5.6.24, and 7.x before 7.0.9 allows remote attackers to cause a denial of service (out-of-bounds write) or execute arbitrary code via a crafted bz2 archive.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'cdf_check_stream_offset' Function Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The cdf_check_stream_offset function in cdf.c in file before 5.19, as used in the Fileinfo component in PHP before 5.4.30 and 5.5.x before 5.5.14, relies on incorrect sector-size data, which allows remote attackers to cause a denial of service (application crash) via a crafted stream offset in a CDF file.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

CVSS Vector: AV:N/AC:M/Au:N/C:N/I:N/A:P

PHP cdf.c Integer Overflow Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Integer overflow in the cdf_read_property_info function in cdf.c in file through 5.19, as used in the Fileinfo component in PHP before 5.4.32 and 5.5.x before 5.5.16, allows remote attackers to cause a denial of service (application crash) via a crafted CDF file. NOTE: this vulnerability exists because of an incomplete fix for CVE-2012-1571.

CVSS Base Score: 4.3

PHP 'cdf_count_chain' Function Denial of Service

Medium

Vulnerability Details

The cdf_count_chain function in cdf.c in file before 5.19, as used in the Fileinfo component in PHP before 5.4.30 and 5.5.x before 5.5.14, does not properly validate sector-count data, which allows remote attackers to cause a denial of service (application crash) via a crafted CDF file.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

PHP 'cdf_read_property_info' Function Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The cdf_read_property_info function in file before 5.19, as used in the Fileinfo component in PHP before 5.4.30 and 5.5.x before 5.5.14, does not properly validate a stream offset, which allows remote attackers to cause a denial of service (application crash) via a crafted CDF file.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'cdf_read_property_info' in Fileinfo Component Denial of Service

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The cdf_read_property_info function in cdf.c in the Fileinfo component in PHP before 5.4.29 and 5.5.x before 5.5.13 allows remote attackers to cause a denial of service (infinite loop or out-of-bounds memory access) via a vector that (1) has zero length or (2) is too long.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'cdf_unpack_summary_info' in Fileinfo Component Denial of Service

Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The cdf_unpack_summary_info function in cdf.c in the Fileinfo component in PHP before 5.4.29 and 5.5.x before 5.5.13 allows remote attackers to cause a denial of service (performance degradation) by triggering many file_printf calls.

PHP 'data_len' Uninitialized Read Vulnerability — Medium

Vulnerability Details

An issue was discovered in the EXIF component in PHP before 7.1.27, 7.2.x before 7.2.16, and 7.3.x before 7.3.3. There is an uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the data_len variable.
Impact:
An attacker could leverage this vulnerability to read the contents of memory to obtain information that could aid in launching further attacks.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of PHP.

CVSS Base Score: 5

PHP dirstream.c 'phar_make_dirstream' Mishandled Zero-size Denial of Service — Medium

Vulnerability Details

The phar_make_dirstream function in ext/phar/dirstream.c in PHP before 5.6.18 and 7.x before 7.0.3 mishandles zero-size ././@LongLink files, which allows remote attackers to cause a denial of service (uninitialized pointer dereference) or possibly have unspecified other impact via a crafted TAR archive.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

CVSS Base Score: 6.8

PHP dns.c 'php_parserr' Function Buffer Overflow Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Multiple buffer overflows in the php_parserr function in ext/standard/dns.c in PHP before 5.4.32 and 5.5.x before 5.5.16 allow remote DNS servers to cause a denial of service (application crash) or possibly execute arbitrary code via a crafted DNS record, related to the dns_get_record function and the dn_expand function. NOTE: this issue exists because of an incomplete fix for CVE-2014-4049.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.8

PHP 'do_soap_call' Function Type Confusion Vulnerability — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The do_soap_call function in ext/soap/soap.c in PHP before 5.4.39, 5.5.x before 5.5.23, and 5.6.x before 5.6.7 does not verify that the uri property is a string, which allows remote attackers to obtain sensitive information by providing crafted serialized data with an int data type, related to a "type confusion" issue.

CVSS Base Score: 5

PHP exif.c 'exif_convert_any_to_int' Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exif_convert_any_to_int function in ext/exif/exif.c in PHP before 5.6.30, 7.0.x before 7.0.15, and 7.1.x before 7.1.1 allows remote attackers to cause a denial of service (application crash) via crafted EXIF data that triggers an attempt to divide the minimum representable negative integer by -1.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5

PHP exif.c 'exif_process_IFD_in_TIFF' Information Disclosure Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exif_process_IFD_in_TIFF function in ext/exif/exif.c in PHP before 5.6.25 and 7.x before 7.0.10 mishandles the case of a thumbnail offset that exceeds the file size, which allows remote attackers to obtain sensitive information from process memory via a crafted TIFF image.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5

PHP 'exif.c' Integer Overflow Vulnerability **Medium**

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

An issue was discovered in PHP before 5.6.37, 7.0.x before 7.0.31, 7.1.x before 7.1.20, and 7.2.x before 7.2.8. An Integer Overflow leads to a heap-based buffer over-read in exif_thumbnail_extract of exif.c.
Impact:
Successfully exploiting this issue may allow a remote attacker to crash the affected application, denying service to legitimate users. Due to the nature of this issue, code execution may be possible but this has not been confirmed.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5

PHP 'exif.c' Out-of-Bounds Read Vulnerability **Medium**

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

An issue was discovered in PHP before 5.6.36, 7.0.x before 7.0.30, 7.1.x before 7.1.17, and 7.2.x before 7.2.5. exif_read_data in ext/exif/exif.c has an out-of-bounds read for crafted JPEG data because exif_iif_add_value mishandles the case of a MakerNote that lacks a final '\0' character.
Impact:
An attacker can exploit these issues to execute arbitrary code in the context of the affected application. Failed exploit attempts may result in a denial-of-service condition.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'EXIF' Extension Crafted JPEG Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exif_ifd_make_value function in exif.c in the EXIF extension in PHP before 5.4.34, 5.5.x before 5.5.18, and 5.6.x before 5.6.2 operates on floating-point arrays incorrectly, which allows remote attackers to cause a denial of service (heap memory corruption and application crash) or possibly execute arbitrary code via a crafted JPEG image with TIFF thumbnail data that is improperly handled by the exif_thumbnail function.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'exif_process_unicode' Function EXIF Data Denial of Service Flaw

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exif_process_unicode function in ext/exif/exif.c in PHP before 5.4.37, 5.5.x before 5.5.21, and 5.6.x before 5.6.5 allows remote attackers to execute arbitrary code or cause a denial of service (uninitialized pointer free and application crash) via crafted EXIF data in a JPEG image.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.8

PHP 'exif_process_user_comment' Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The exif_process_user_comment function in ext/exif/exif.c in PHP before 5.5.38, 5.6.x before 5.6.24, and 7.x before 7.0.9 allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a crafted JPEG image.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

PHP 'ext/iconv/iconv.c' Infinite Loop Vulnerability — Medium

Vulnerability Details

An issue was discovered in PHP before 5.6.36, 7.0.x before 7.0.30, 7.1.x before 7.1.17, and 7.2.x before 7.2.5. An infinite loop exists in ext/iconv/iconv.c because the iconv stream filter does not reject invalid multibyte sequences.
Impact:
A remote user can cause a denial of service condition on the asset.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

PHP 'ext/ldap/ldap.c' Denial of Service Vulnerability — Medium

Vulnerability Details

An issue was discovered in PHP before 5.6.36, 7.0.x before 7.0.30, 7.1.x before 7.1.17, and 7.2.x before 7.2.5. ext/ldap/ldap.c allows remote LDAP servers to cause a denial of service (NULL pointer dereference and application crash) because of mishandling of the ldap_get_dn return value.
Impact:
A remote user can cause a denial of service condition on the asset.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

PHP 'ext/phar/phar.c' Buffer Over-read Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/phar/phar.c in PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 allows remote attackers to obtain sensitive information from process memory or cause a denial of service (buffer over-read and application crash) via a crafted length value in conjunction with crafted serialized data in a phar archive, related to the phar_parse_metadata and phar_parse_pharfile functions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5.8

PHP 'ext/phar/phar_object.c' Cross-site Scripting Vulnerability Medium

Vulnerability Details

An issue was discovered in ext/phar/phar_object.c in PHP before 5.6.36, 7.0.x before 7.0.30, 7.1.x before 7.1.17, and 7.2.x before 7.2.5. There is Reflected XSS on the PHAR 403 and 404 error pages via request data of a request for a .phar file. NOTE: this vulnerability exists because of an incomplete fix for CVE-2018-5712.
Impact:
An attacker may leverage this vulnerability to execute arbitrary HTML and JavaScript in the browser of an unsuspecting user in the context of the affected site. This may let the attacker steal cookie-based authentication credentials and launch other attacks.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

PHP 'ext/spl/spl_array.c' Denial of Service Vulnerability — Medium

Vulnerability Details

Use-after-free vulnerability in ext/spl/spl_array.c in the SPL component in PHP through 5.5.14 allows context-dependent attackers to cause a denial of service or possibly have unspecified other impact via crafted ArrayIterator usage within applications in certain web-hosting environments.
Impact:
An attacker could cause a denial of service condition on the asset.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Fileinfo Component Denial of Service

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The cdf_read_short_sector function in cdf.c in file before 5.19, as used in the Fileinfo component in PHP before 5.4.30 and 5.5.x before 5.5.14, allows remote attackers to cause a denial of service (assertion failure and application exit) via a crafted CDF file.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'Fileinfo' Component Denial of Service Vulnerability

Medium

Vulnerability Details

file before 5.18, as used in the Fileinfo component in PHP before 5.6.0, allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a zero root_storage value in a CDF file, related to cdf.c and readcdf.c.

Impact:
An attacker could cause a denial of service condition on the target asset.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

PHP Fileinfo Component Pascal String Denial of Service Flaw — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The mconvert function in softmagic.c in file before 5.21, as used in the Fileinfo component in PHP before 5.4.37, 5.5.x before 5.5.21, and 5.6.x before 5.6.5, does not properly handle a certain string-length field during a copy of a truncated version of a Pascal string, which might allow remote attackers to cause a denial of service (out-of-bounds memory access and application crash) via a crafted file.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5

PHP 'fsockopen' Server-Side Request Forgery Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

PHP through 7.1.11 enables potential SSRF in applications that accept an fsockopen or pfsockopen hostname argument with an expectation that the port number is constrained. Because a :port syntax is recognized, fsockopen will use the port number that is specified in the hostname argument, instead of the port number in the second argument of the function.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP '_gd2GetHeader' Denial of Service Vulnerability — Medium

Vulnerability Details

Integer overflow in the _gd2GetHeader function in gd_gd2.c in the GD Graphics Library (aka libgd) before 2.2.3, as used in PHP before 5.5.37, 5.6.x before 5.6.23, and 7.x before 7.0.8, allows remote attackers to cause a denial of service (heap-based buffer overflow and application crash) or possibly have unspecified other impact via crafted chunk dimensions in an image.
Impact:
A remote attacker could possibly execute arbitrary code within the context of the process or cause a denial of service condition.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'gd.c' Denial of Service Vulnerability

Medium

Vulnerability Details

Stack consumption vulnerability in the gdImageFillToBorder function in gd.c in the GD Graphics Library (aka libgd) before 2.2.2, as used in PHP before 5.6.28 and 7.x before 7.0.13, allows remote attackers to cause a denial of service (segmentation violation) via a crafted imagefilltoborder call that triggers use of a negative color value.
Impact:
An attacker could cause a denial of service condition on the asset.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

PHP gd_ctx.c Arbitrary File Overwrite Vulnerabilty — Medium

Vulnerability Details

gd_ctx.c in the GD component in PHP 5.4.x before 5.4.32 and 5.5.x before 5.5.16 does not ensure that pathnames lack %00 sequences, which might allow remote attackers to overwrite arbitrary files via crafted input to an application that calls the (1) imagegd, (2) imagegd2, (3) imagegif, (4) imagejpeg, (5) imagepng, (6) imagewbmp, or (7) imagewebp function.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

PHP gd_gif_in.c Crafted GIF Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

gd_gif_in.c in the GD Graphics Library (aka libgd), as used in PHP before 5.6.33, 7.0.x before 7.0.27, 7.1.x before 7.1.13, and 7.2.x before 7.2.1, has an integer signedness error that leads to an infinite loop via a crafted GIF file, as demonstrated by a call to the imagecreatefromgif or imagecreatefromstring PHP function. This is related to GetCode_ and gdImageCreateFromGifCtx.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

CVSS Vector: AV:N/AC:M/Au:N/C:N/I:N/A:P

PHP gd_gif_in.c 'gdImageCreateFromGifCtx' Information Disclosure — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd), as used in PHP before 5.6.31 and 7.x before 7.1.7, does not zero colorMap arrays before use. A specially crafted GIF image could use the uninitialized tables to read ~700 bytes from the top of the stack, potentially disclosing sensitive information.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'gdImageCreate' Denial of Service Vulnerability — Medium

Vulnerability Details

Integer overflow in the gdImageCreate function in gd.c in the GD Graphics Library (aka libgd) before 2.0.34RC1, as used in PHP before 5.5.37, 5.6.x before 5.6.23, and 7.x before 7.0.8, allows remote attackers to cause a denial of service (heap-based buffer overflow and application crash) or possibly have unspecified other impact via a crafted image dimensions.
Impact:
An attacker could cause a denial of service condition on the asset.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'gd_interpolation.c' Denial of Service Vulnerability — Medium

Vulnerability Details

gd_interpolation.c in the GD Graphics Library (aka libgd) before 2.1.1, as used in PHP before 5.5.36, 5.6.x before 5.6.22, and 7.x before 7.0.7, allows remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact via a crafted image that is mishandled by the imagescale function.
Impact:
An attacker could cause a denial of service condition on the asset.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

PHP gd_interpolation.c 'gdImageScaleTwoPass' Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The gdImageScaleTwoPass function in gd_interpolation.c in the GD Graphics Library (aka libgd) before 2.2.0, as used in PHP before 5.6.12, uses inconsistent allocate and free approaches, which allows remote attackers to cause a denial of service (memory consumption) via a crafted call, as demonstrated by a call to the PHP imagescale function.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'GetCode_' Function Crafted GIF Image Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The GetCode_ function in gd_gif_in.c in GD 2.1.1 and earlier, as used in PHP before 5.5.21 and 5.6.x before 5.6.5, allows remote attackers to cause a denial of service (buffer over-read and application crash) via a crafted GIF image that is improperly handled by the gdImageCreateFromGif function.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP GMP Interfaces Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

** DISPUTED ** The GNU Multiple Precision Arithmetic Library (GMP) interfaces for PHP through 7.1.4 allow attackers to cause a denial of service (memory consumption and application crash) via operations on long strings. NOTE: the vendor disputes this, stating "There is no security issue here, because GMP safely aborts in case of an OOM condition. The only attack vector here is denial of service. However, if you allow attacker-controlled, unbounded allocations you have a DoS vector regardless of GMP's OOM behavior."

CVSS Base Score: 7.5

PHP HTTP_PROXY Environment Variable Namespace Conflict — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

PHP through 7.0.8 does not attempt to address RFC 3875 section 4.1.18 namespace conflicts and therefore does not protect applications from the presence of untrusted client data in the HTTP_PROXY environment variable, which might allow remote attackers to redirect an application's outbound HTTP traffic to an arbitrary proxy server via a crafted Proxy header in an HTTP request, as demonstrated by (1) an application that makes a getenv('HTTP_PROXY') call or (2) a CGI configuration of PHP, aka an "httpoxy" issue.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP JPEG Denial of Service Vulnerability — Medium

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

exif_process_IFD_in_MAKERNOTE in ext/exif/exif.c in PHP before 5.6.37, 7.0.x before 7.0.31, 7.1.x before

7.1.20, and 7.2.x before 7.2.8 allows remote attackers to cause a denial of service (out-of-bounds read and application crash) via a crafted JPEG file.
Impact:
An attacker could cause a denial of service condition on the asset.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

PHP 'linkinfo' File Path Disclosure Vulnerability — Medium

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

An issue was discovered in ext/standard/link_win32.c in PHP before 5.6.37, 7.0.x before 7.0.31, 7.1.x before 7.1.20, and 7.2.x before 7.2.8. The linkinfo function on Windows doesn't implement the open_basedir check. This could be abused to find files on paths outside of the allowed directories.
Impact:
An attacker could obtain file paths they should not have permissions to see.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

PHP "main/php_open_temporary_file.c" Thread Safety Denial of Service Flaw

Medium

Vulnerability Details

main/php_open_temporary_file.c in PHP before 5.5.28 and 5.6.x before 5.6.12 does not ensure thread safety, which allows remote attackers to cause a denial of service (race condition and heap memory corruption) by leveraging an application that performs many temporary-file accesses.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

CVSS Base Score: 5.9

PHP 'mconvert' Function Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Buffer overflow in the mconvert function in softmagic.c in file before 5.19, as used in the Fileinfo component in PHP before 5.4.30 and 5.5.x before 5.5.14, allows remote attackers to cause a denial of service (application crash) via a crafted Pascal string in a FILE_PSTRING conversion.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'mod_php' Or 'php-fpm' Information Disclosure

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

An issue was discovered in PHP 5.x and 7.x, when the configuration uses apache2handler/mod_php or php-fpm with OpCache enabled. With 5.x after 5.6.28 or 7.x after 7.0.13, the issue is resolved in a non-default configuration with the opcache.validate_permission=1 setting. The vulnerability details are as follows. In PHP SAPIs where PHP interpreters share a common parent process, Zend OpCache creates a shared memory object owned by the common parent during initialization. Child PHP processes inherit the SHM descriptor, using it to cache and retrieve compiled script bytecode ("opcode" in PHP jargon). Cache keys vary depending on configuration, but filename is a central key component, and compiled opcode can generally be run if a script's filename is known or can be guessed. Many common shared-hosting configurations change EUID in child processes to enforce privilege separation among hosted users (for example using mod_ruid2 for the Apache HTTP Server, or php-fpm user settings). In these scenarios, the default Zend OpCache behavior defeats script file permissions by sharing a single SHM cache among all child PHP processes. PHP scripts often contain sensitive information: Think of CMS configurations where reading or running another user's script usually means gaining privileges to the CMS database.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'move_uploaded_file' Extension Restrictions Bypass Flaw — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The move_uploaded_file implementation in ext/standard/basic_functions.c in PHP before 5.4.39, 5.5.x before 5.5.23, and 5.6.x before 5.6.7 truncates a pathname upon encountering a \x00 character, which allows remote attackers to bypass intended extension restrictions and create files with unexpected names via a crafted second argument. NOTE: this vulnerability exists because of an incomplete fix for CVE-2006-7243.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP msgformat_format.c 'MessageFormatter::formatMessage' Denial of Service Vulnerability

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/intl/msgformat/msgformat_format.c in PHP before 5.6.26 and 7.x before 7.0.11 does not properly restrict the locale length provided to the Locale class in the ICU library, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact via a MessageFormatter::formatMessage call with a long first argument.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'multipart_buffer_headers' Function Algorithmic Complexity Vulnerability

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Algorithmic complexity vulnerability in the multipart_buffer_headers function in main/rfc1867.c in PHP before 5.4.41, 5.5.x before 5.5.25, and 5.6.x before 5.6.9 allows remote attackers to cause a denial of service (CPU consumption) via crafted form data that triggers an improper order-of-growth outcome.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Multiple Pathname Sanitization Remote Arbitrary File Access Vulnerabilities — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 does not ensure that pathnames lack %00 sequences, which might allow remote attackers to read or write to arbitrary files via crafted input to an application that calls (1) a DOMDocument load method, (2) the xmlwriter_open_uri function, (3) the finfo_file function, or (4) the hash_hmac_file function, as demonstrated by a filename\0.xml attack that bypasses an intended configuration in which client users may read only .xml files.

PHP mysqlnd Man in the Middle via Cleartext-downgrade — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/mysqlnd/mysqlnd.c in PHP before 5.4.43, 5.5.x before 5.5.27, and 5.6.x before 5.6.11 uses a client SSL option to mean that SSL is optional, which allows man-in-the-middle attackers to spoof servers via a cleartext-downgrade attack, a related issue to CVE-2015-3152.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP mysqlnd_wireprotocol.c BIT Field Heap Buffer Overflow — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/mysqlnd/mysqlnd_wireprotocol.c in PHP before 5.6.26 and 7.x before 7.0.11 does not verify that a BIT field has the UNSIGNED_FLAG flag, which allows remote MySQL servers to cause a denial of service (heap-based buffer overflow) or possibly have unspecified other impact via crafted field metadata.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Non-Blocking STDIN Stream Denial of Service Vulnerability — Medium

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

An issue was discovered in PHP 7.3.x before 7.3.0alpha3, 7.2.x before 7.2.8, and before 7.1.20. The php-fpm master process restarts a child process in an endless loop when using program execution functions (e.g., passthru, exec, shell_exec, or system) with a non-blocking STDIN stream, causing this master process to consume 100% of the CPU, and consume disk space with a large volume of error logs, as demonstrated by an attack by a customer of a shared-hosting facility.
Impact:
An attacker could cause a denial of service condition on the asset.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP "odbc_bindcols" Function Denial of Service Flaw — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The odbc_bindcols function in ext/odbc/php_odbc.c in PHP before 5.6.12 mishandles driver behavior for SQL_WVARCHAR columns, which allows remote attackers to cause a denial of service (application crash) in opportunistic circumstances by leveraging use of the odbc_fetch_array function to access a certain type of Microsoft SQL Server table.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 7.5

URL	https://cwe.mitre.org/data/definitions/20.html

PHP openssl.c Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

In PHP before 5.6.31, 7.x before 7.0.21, and 7.1.x before 7.1.7, the openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function, which could lead to a crash of the PHP interpreter, related to an interpretation conflict for a negative number in ext/openssl/openssl.c, and an OpenSSL documentation omission.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP parse_date.c 'php_parse_date' Information Disclosure — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

In PHP before 5.6.31, 7.x before 7.0.21, and 7.1.x before 7.1.7, an error in the date extension's timelib_meridian parsing code could be used by attackers able to supply date strings to leak information from the interpreter, related to ext/date/lib/parse_date.c out-of-bounds reads affecting the php_parse_date function. NOTE: the correct fix is in the e8b7698f5ee757ce2c8bd10a192a491a498f891c commit, not the bd77ac90d3bdf31ce2a5251ad92e9e75 gist.

False Positive Notes

PHP phar.c 'phar_parse_pharfile' Denial of Service — Medium

Vulnerability Details

Integer overflow in the phar_parse_pharfile function in ext/phar/phar.c in PHP before 5.6.30 and 7.0.x before 7.0.15 allows remote attackers to cause a denial of service (memory consumption or application crash) via a truncated manifest entry in a PHAR archive.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

PHP phar.c 'phar_parse_pharfile' Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

In PHP before 5.6.30 and 7.x before 7.0.15, the PHAR archive handler could be used by attackers supplying malicious archive files to crash the PHP interpreter or potentially disclose information due to a buffer over-read in the phar_parse_pharfile function in ext/phar/phar.c.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP PharData 'extractTo' Directory Traversal — Medium

Vulnerability Details

Directory traversal vulnerability in the PharData class in PHP before 5.4.44, 5.5.x before 5.5.28, and 5.6.x before 5.6.12 allows remote attackers to write to arbitrary files via a .. (dot dot) in a ZIP archive entry that is mishandled during an extractTo call.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

PHP 'phar_parse_tarfile' Function Denial of Service — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The phar_parse_tarfile function in ext/phar/tar.c in PHP before 5.4.41, 5.5.x before 5.5.25, and 5.6.x before 5.6.9 does not verify that the first character of a filename is different from the \0 character, which allows remote attackers to cause a denial of service (integer underflow and memory corruption) via a crafted entry in a tar archive.

CVSS Base Score: 5

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:P

PHP 'php_handler' Function Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The php_handler function in sapi/apache2handler/sapi_apache2.c in PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8, when the Apache HTTP Server 2.4.x is used, allows remote attackers to cause a denial of service (application crash) or possibly execute arbitrary code via pipelined HTTP requests that result in a "deconfigured interpreter."

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.8

PHP 'php_imap.c' Denial of Service Vulnerability — Medium

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of PHP.

Vulnerability Details

ext/imap/php_imap.c in PHP 5.x and 7.x before 7.3.0 allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via an empty string in the message argument to the imap_mail function.
Impact:
Attackers can exploit this issue to cause denial-of-service condition, denying service to legitimate users.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP PostgreSQL 'build_tablename' Function Denial of Service Flaw — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The build_tablename function in pgsql.c in the PostgreSQL (aka pgsql) extension in PHP through 5.6.7 does not validate token extraction for table names, which allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a crafted name.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5

PHP PostgreSQL Extension 'php_pgsql_meta_data' Function Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The php_pgsql_meta_data function in pgsql.c in the PostgreSQL (aka pgsql) extension in PHP before 5.4.42, 5.5.x before 5.5.26, and 5.6.x before 5.6.10 does not validate token extraction for table names, which might allow remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a crafted name. NOTE: this vulnerability exists because of an incomplete fix for CVE-2015-1352.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'rename()' Sensitive Data Disclosure Vulnerability — Medium

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of PHP.

Vulnerability Details

An issue was discovered in PHP before 7.1.27, 7.2.x before 7.2.16, and 7.3.x before 7.3.3. Due to the way rename() across filesystems is implemented, it is possible that file being renamed is briefly available with wrong permissions while the rename is ongoing, thus enabling unauthorized users to access the data.
Impact:
An attacker could leverage this vulnerability to gain access to file data without authorization.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5

PHP 'sapi_header_op' Function Cross-Site Scripting Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The sapi_header_op function in main/SAPI.c in PHP before 5.4.38, 5.5.x before 5.5.22, and 5.6.x before 5.6.6 supports deprecated line folding without considering browser compatibility, which allows remote attackers to conduct cross-site scripting (XSS) attacks against Internet Explorer by leveraging (1) %0A%20 or (2) %0D%0A%20 mishandling in the header function.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.1

PHP session.c Invalid Session Names Object Injection — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

ext/session/session.c in PHP before 5.6.25 and 7.x before 7.0.10 skips invalid session names in a way that triggers incorrect parsing, which allows remote attackers to inject arbitrary-type session data by leveraging control of a session name, as demonstrated by object injection.

CVSS Base Score: 5

PHP 'stream_resolve_include_path ' Function Pathname Sanitization Remote Arbitrary File Access Vulnerability — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 does not ensure that pathnames lack %00 sequences, which might allow remote attackers to read arbitrary files via crafted input to an application that calls the stream_resolve_include_path function in ext/standard/streamsfuncs.c, as demonstrated by a filename\0.extension attack that bypasses an intended configuration in which client users may read files with only one specific extension.

PHP url.c 'parse_url' Restriction Bypass — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

In PHP before 5.6.28 and 7.x before 7.0.13, incorrect handling of various URI components in the URL parser could be used by attackers to bypass hostname-specific URL checks, as demonstrated by evil.example.com:80#@good.example.com/ and evil.example.com:80?@good.example.com/ inputs to the parse_url function (implemented in the php_url_parse_ex function in ext/standard/url.c).

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP util.c 'phar_get_entry_data' Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The phar_get_entry_data function in ext/phar/util.c in PHP before 5.5.30 and 5.6.x before 5.6.14 allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a .phar file with a crafted TAR archive entry in which the Link indicator references a file that does not exist.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.8

PHP 'value_len' Uninitialized Read Vulnerability — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of PHP.

Vulnerability Details

An issue was discovered in the EXIF component in PHP before 7.1.27, 7.2.x before 7.2.16, and 7.3.x before 7.3.3. There is an uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the maker_note->offset relationship to value_len.
Impact:
An attacker could leverage this vulnerability to read the contents of memory to obtain information that could aid in launching further attacks.

CVSS Base Score: 5

CVSS Vector: AV:N/AC:L/Au:N/C:P/I:N/A:N

PHP 'var_unserializer.c' Denial of Service Vulnerability — Medium

Vulnerability Details

ext/standard/var_unserializer.c in PHP 5.x through 7.1.24 allows attackers to cause a denial of service (application crash) via an unserialize call for the com, dotnet, or variant class.
Impact:
Attackers can exploit these issues to crash the affected application, denying service to legitimate users.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of PHP.

PHP var_unserializer.c 'object_common1' Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The object_common1 function in ext/standard/var_unserializer.c in PHP before 5.6.30, 7.0.x before 7.0.15, and 7.1.x before 7.1.1 allows remote attackers to cause a denial of service (buffer over-read and application crash) via crafted serialized data that is mishandled in a finish_nested_data call.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'wddx.c' PDORow String Denial of Service — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

ext/wddx/wddx.c in PHP before 5.6.28 and 7.x before 7.0.13 allows remote attackers to cause a denial of service (NULL pointer dereference) via crafted serialized data in a wddxPacket XML document, as demonstrated by a PDORow string.

CVSS Base Score: 5

PHP wddx.c 'php_wddx_pop_element' NULL Pointer Dereference Denial of Service Vulnerability

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The php_wddx_pop_element function in ext/wddx/wddx.c in PHP before 5.6.25 and 7.x before 7.0.10 allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) or possibly have unspecified other impact via an invalid base64 binary value, as demonstrated by a wddx_deserialize call that mishandles a binary element in a wddxPacket XML document.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP WSDL Injection Attack Vulnerability — Medium

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

The default soap.wsdl_cache_dir setting in (1) php.ini-production and (2) php.ini-development in PHP through 5.6.7 specifies the /tmp directory, which makes it easier for local users to conduct WSDL injection attacks by creating a file under /tmp with a predictable filename that is used by the get_sdl function in ext/soap/php_sdl.c.
Impact:
An attacker can exploit this issue to perform certain unauthorized actions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'xmlrpc_decode()' Memory Over-Read Vulnerability — Medium

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of PHP.

Vulnerability Details

An issue was discovered in PHP before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14, and 7.3.x before 7.3.1. xmlrpc_decode() can allow a hostile XMLRPC server to cause PHP to read memory outside of allocated areas in base64_decode_xmlrpc in ext/xmlrpc/libxmlrpc/base64.c.
Impact:
Successfully exploiting these issues allow attackers to execute arbitrary code in the affected asset or obtain sensitive information. Failed exploits will result in denial-of-service conditions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP XMLRPC Extension Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Buffer overflow in the date_from_ISO8601 function in the mkgmtime implementation in libxmlrpc/xmlrpc.c in the XMLRPC extension in PHP before 5.4.34, 5.5.x before 5.5.18, and 5.6.x before 5.6.2 allows remote attackers to cause a denial of service (application crash) via (1) a crafted first argument to the xmlrpc_set_type function or (2) a crafted argument to the xmlrpc_decode function, related to an out-of-bounds read operation.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP xsltprocessor.c 'xsl_ext_function_php' Denial of Service During Initial Error Checking

Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The xsl_ext_function_php function in ext/xsl/xsltprocessor.c in PHP before 5.4.45, 5.5.x before 5.5.29, and 5.6.x before 5.6.13, when libxml2 before 2.9.2 is used, does not consider the possibility of a NULL valuePop return value before proceeding with a free operation during initial error checking, which allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a crafted XML document, a different vulnerability than CVE-2015-6838.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP xsltprocessor.c 'xsl_ext_function_php' Denial of Service During Principal Argument Loop — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The xsl_ext_function_php function in ext/xsl/xsltprocessor.c in PHP before 5.4.45, 5.5.x before 5.5.29, and 5.6.x before 5.6.13, when libxml2 before 2.9.2 is used, does not consider the possibility of a NULL valuePop return value before proceeding with a free operation after the principal argument loop, which allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a crafted XML document, a different vulnerability than CVE-2015-6837.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP Zend Denial of Service Vulnerability — Medium

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

In PHP before 5.6.31, 7.x before 7.0.21, and 7.1.x before 7.1.7, a stack-based buffer overflow in the zend_ini_do_op() function in Zend/zend_ini_parser.c could cause a denial of service or potentially allow executing code. NOTE: this is only relevant for PHP applications that accept untrusted input

(instead of the system's php.ini file) for the parse_ini_string or parse_ini_file function, e.g., a web application for syntax validation of php.ini directives.
Impact:
An attacker could cause a denial of service state on the target.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.8

PHP zend_exceptions.c Crafted Exception Object Denial of Service — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Zend/zend_exceptions.c in PHP, possibly 5.x before 5.6.28 and 7.x before 7.0.13, allows remote attackers to cause a denial of service (infinite loop) via a crafted Exception object in serialized data, a related issue to CVE-2015-8876.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

PHP 'ZipArchive::extractTo' Function Directory Traversal — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Directory traversal vulnerability in the ZipArchive::extractTo function in ext/zip/php_zip.c in PHP before 5.4.45, 5.5.x before 5.5.29, and 5.6.x before 5.6.13 and ext/zip/ext_zip.cpp in HHVM before 3.12.1 allows remote attackers to create arbitrary empty directories via a crafted ZIP archive.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Ruby 'Oniguruma-mod' and PHP 'mbstring' forward_search_range Denial of Service — Medium

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

An issue was discovered in Oniguruma 6.2.0, as used in Oniguruma-mod in Ruby through 2.4.1 and mbstring in PHP through 7.1.5. A SIGSEGV occurs in left_adjust_char_head() during regular expression compilation. Invalid handling of reg->dmax in forward_search_range() could result in an invalid pointer dereference, normally as an immediate denial-of-service condition.

CVSS Base Score: 5

Samba Confidential Attribute Values Disclosure Vulnerability — Medium

Solution Details

Please upgrade to the most current stable release of Samba, available at http://www.samba.org.
Workarounds:
The only workaround is not to use the SEARCH_FLAG_CONFIDENTIAL
searchFlags bit, not to expect confidentiality of the attribute list
above nor to set access control entries of a similar nature on LDAP
objects.

Vulnerability Details

The Samba Active Directory LDAP server was vulnerable to an information disclosure flaw because of missing access control checks. An authenticated attacker could use this flaw to extract confidential attribute values using LDAP search expressions. Samba versions before 4.6.16, 4.7.9 and 4.8.4 are vulnerable.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba 'dirsync' Denial of Service Vulnerability — Medium

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Samba.

Vulnerability Details

A flaw was found in Samba where an attacker can crash AD DC LDAP server via dirsync resulting in denial of service. Privilege escalation is not possible with this issue.
Impact:
An attacker can exploit this vulnerability to cause a denial-of-service condition, denying service to legitimate users.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4

Samba Incorrect 'KDC' Implementation Vulnerability — Medium

Vulnerability Details

The checksum validation in the S4U2Self handler in the embedded Heimdal KDC did not first confirm that the checksum was keyed, allowing replacement of the requested target (client) principal.
Impact:

An attacker could leverage this vulnerability to bypass certain security restrictions and perform unauthorized actions by conducting a man-in-the-middle attack.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Samba.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba 'KDC' Denial of Service Vulnerability — Medium

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of Samba.

Vulnerability Details

Samba from version 4.3.0 and before versions 4.7.12, 4.8.7 and 4.9.3 are vulnerable to a denial of service. When configured to accept smart-card authentication, Samba's KDC will call talloc_free() twice on the same memory if the principal in a validly signed certificate does not match the principal in the AS-REQ. This is only possible after authentication with a trusted certificate. talloc is robust against further corruption from a double-free with talloc_free() and directly calls abort(), terminating the KDC process.
Impact:
An attacker can exploit this issue to cause the application to crash, denying service to legitimate users.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4

Samba Kerberos Impersonation Vulnerability — Medium

Vulnerability Details

It was found that Samba before versions 4.5.3, 4.4.8, 4.3.13 always requested forwardable tickets when using Kerberos authentication. A service to which Samba authenticated using Kerberos could subsequently use the ticket to impersonate Samba to other services or domain users.
Impact:
An attacker can exploit this issue to impersonate arbitrary users and perform unauthorized actions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please upgrade to the most current stable release of Samba, available at https://wiki.samba.org/index.php/Updating_Samba

Samba 'LDAP' Search Denial of Service Vulnerability — Medium

Vulnerability Details

Samba from version 4.0.0 and before versions 4.7.12, 4.8.7, 4.9.3 is vulnerable to a denial of service. During the processing of an LDAP search before Samba's AD DC returns the LDAP entries to the client, the entries are cached in a single memory object with a maximum size of 256MB. When this size is reached, the Samba process providing the LDAP service will follow the NULL pointer, terminating the

process. There is no further vulnerability associated with this issue, merely a denial of service.
Impact:
An attacker can exploit this issue to cause the application to crash, denying service to legitimate users.

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of Samba.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba 'LDAP' Server Denial of Service Vulnerability — Medium

Vulnerability Details

A denial of service vulnerability was discovered in Samba's LDAP server before versions 4.7.12, 4.8.7, and 4.9.3. A CNAME loop could lead to infinite recursion in the server. An unprivileged local attacker could create such an entry, leading to denial of service.
Impact:
An attacker can exploit this issue to cause the application to crash, denying service to legitimate users.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Refer to External References for a link to upgrade to the most recent stable version of Samba.

Samba Man in the Middle Hijack Vulnerability — Medium

Solution Details

Please upgrade to the most current stable release of Samba, available at http://www.samba.org.
Workarounds:
The missing implied signing for 'smb2mount -e', 'smbcacls -e' and 'smbcquotas -e' can be enforced by explicitly using '--signing=required' on the commandline or "client signing = required" in smb.conf.

Vulnerability Details

It was found that samba before 4.4.16, 4.5.x before 4.5.14, and 4.6.x before 4.6.8 did not enforce "SMB signing" when certain configuration options were enabled. A remote attacker could launch a man-in-the-middle attack and retrieve information in plain-text.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba Man in the Middle Vulnerability — Medium

Solution Details

Please upgrade to the most current stable release of Samba, available at http://www.samba.org.
Workarounds:
Keep the default of "client max protocol = NT1".

Vulnerability Details

A flaw was found in the way samba client before samba 4.4.16, samba 4.5.14 and samba 4.6.8 used encryption with the max protocol set as SMB3. The connection could lose the requirement for signing and encrypting to any DFS redirects, allowing an attacker to read or alter the contents of the connection via a man-in-the-middle attack.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba 'ndr_pull_dnsp_name' Remote Privilege Escalation Vulnerability — Medium

Vulnerability Details

A flaw was found in samba versions 4.0.0 to 4.5.2. The Samba routine ndr_pull_dnsp_name contains an integer wrap problem, leading to an attacker-controlled memory overwrite. ndr_pull_dnsp_name parses data from the Samba Active Directory ldb database. Any user who can write to the dnsRecord attribute over LDAP can trigger this memory corruption. By default, all authenticated LDAP users can write to the dnsRecord attribute on new DNS objects. This makes the defect a remote privilege escalation.
Impact:
An attacker can exploit this issue to execute arbitrary code in the context of the affected application. Failed exploit attempts will likely result in a denial of service.

Solution Details

Please upgrade to the most current stable release of Samba, available at https://wiki.samba.org/index.php/Updating_Samba

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba November 2021 Security Update — Medium

Solution Details

Please upgrade to the latest version of Samba or patch your system (if applicable).

Samba 4.15.2, 4.14.10 and 4.13.14 have been issued as security releases to correct the defect. Samba vendors and administrators running affected versions are advised to upgrade or apply the patch as soon as possible.

For potential patches: https://www.samba.org/samba/security/

Vulnerability Details

There are several vulnerabilities resolved ranging from fragment injection to use after free vulnerabilities and privilege escalation. It is recommended to update Samba to the latest version to avoid exploitation. CVE-2020-25717, a user in an AD domain could become root on domain members.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba 'PAC' Checksum Denial of Service Vulnerability — Medium

Solution Details

Please upgrade to the most current stable release of Samba, available at
https://wiki.samba.org/index.php/Updating_Samba

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Samba version 4.0.0 up to 4.5.2 is vulnerable to privilege elevation due to incorrect handling of the PAC (Privilege Attribute Certificate) checksum. A remote, authenticated, attacker can cause the winbindd process to crash using a legitimate Kerberos ticket. A local service with access to the winbindd privileged pipe can cause winbindd to cache elevated access permissions.
Impact:
An attacker can exploit this issue to cause the application to crash the winbindd process, denying service to legitimate users.

Samba Password Change Vulnerability — Medium

Solution Details

Please upgrade to the most current stable release of Samba, available at http://www.samba.org.
Workarounds:
Possible workarounds are described at a dedicated page in the Samba wiki:

https://wiki.samba.org/index.php/CVE-2018-1057

Vulnerability Details

On a Samba 4 AD DC the LDAP server in all versions of Samba from 4.0.0 onwards incorrectly validates permissions to modify passwords over LDAP allowing authenticated users to change any other users' passwords, including administrative users and privileged service accounts (eg Domain Controllers).

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.5

Samba Registry Hive File Creation Vulnerability — Medium

Vulnerability Details

A flaw was found in the way samba implemented an RPC endpoint emulating the Windows registry service API. An unprivileged attacker could use this flaw to create a new registry hive file anywhere they have unix permissions which could lead to creation of a new file in the Samba share. Versions before

4.8.11, 4.9.6 and 4.10.2 are vulnerable.
Impact:
Authenticated attackers with write permissions could leverage this vulnerability to trigger a symlink traversal to write or detect files outside the Samba share.

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Samba.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 5.5

CVSS Vector: AV:N/AC:L/Au:S/C:N/I:P/A:P

Samba Server Memory Information Leak over SMB1 — Medium

Solution Details

Please upgrade to the most current stable release of Samba, available at http://www.samba.org.
Workarounds:
As this is an SMB1-only vulnerability, it can be avoided by setting
the server to only use SMB2 via adding:

server min protocol = SMB2_02

to the [global] section of your smb.conf and restarting smbd.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

An information leak flaw was found in the way SMB1 protocol was implemented by Samba before 4.4.16, 4.5.x before 4.5.14, and 4.6.x before 4.6.8. A malicious client could use this flaw to dump server memory contents to a file on the samba share or to a shared printer, though the exact area of server memory cannot be controlled by the attacker.

CVSS Base Score: 4.8

CVSS Vector: AV:A/AC:L/Au:N/C:P/I:P/A:N

Samba 'smbXcli_base.c' Man-In-The-Middle Client-Signing Protection Bypass — Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

libcli/smb/smbXcli_base.c in Samba 4.x before 4.2.14, 4.3.x before 4.3.11, and 4.4.x before 4.4.5 allows man-in-the-middle attackers to bypass a client-signing protection mechanism, and consequently spoof SMB2 and SMB3 servers, via the (1) SMB2_SESSION_FLAG_IS_GUEST or (2) SMB2_SESSION_FLAG_IS_NULL flag.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Samba Unauthorized File Creation Vulnerability — Medium

Solution Details

Refer to the External References for a link to upgrade to the most recent stable version of Samba.

Vulnerability Details

A flaw was found in the samba where a malicious server can supply a pathname to the client with separators. This could allow the client to access files and folders outside of the SMB network pathnames.
Impact:
An attacker could leverage this vulnerability to create files outside of the current working directory using the privileges of the client user.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

Slowloris Resource Depletion And Denial Of Service — Medium

False Positive Notes

This item may be a false positive under certain conditions or if a backported solution has been applied. Please validate and document remediation efforts through Active View.

Solution Details

This attack can be mitigated by; 1) limiting the number of inactive concurrent web server connections a single user may be allowed to maintain, or 2) setting a minimum threshold of data per second a web server connection is allowed to maintain without being dropped.

Examples of applicable apache modules useful for implementing suggested remediation include:
mod_reqtimeout - http://httpd.apache.org/docs/2.3/mod/mod_reqtimeout.html
mod_qos - http://sourceforge.net/projects/mod-qos/
mod_cband - http://cband.linux.pl
mod_limitpconn - http://dominia.org/djao/limitipconn.html
mod_evasive - http://www.networkdweebs.com/stuff/security.html
mod_security - http://www.modsecurity.org/
mod_antiloris - ftp://ftp.monshouwer.eu/pub/linux/mod_antiloris/

Additional third party modules may also be available. Please contact the vendor for additional information.

Vulnerability Details

This host is running a web server that appears to utilize a configuration which allows a single remote host to consume all connection resources. The slowloris denial of service is achieved by systematically establishing and maintaining connections through partial header requests and http keepalive messages. The attacker can continue this methodology until all web server connections are tied up, resulting in a complete denial of service to legitimate users. Web servers that utilize threading are more susceptible to a slowloris attack. In contrast to other web server denial of service techniques, this attack only requires a tiny amount of bandwidth and a single host IP address.

CVSS Base Score: 5

SMB Writeable Directories — Medium

Vulnerability Details

The remote host has SMB sharing enabled and contains directories which are writeable by anonymous users. A malicious user can leverage this capability in order to create, modify or delete files. Possible attack scenarios include the creation of malicious executables or falsified information that is now trusted by legitimate users of the system.

Solution Details

If it is unnecessary for anonymous users to have write privileges on the vulnerable SMB directories, consider disabling write privileges or completely revoking anonymous access. Running services with unnecessary privileges gives malicious users a larger attack surface.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.4

CVSS Vector: AV:N/AC:L/Au:N/C:P/I:P/A:N

Type	Reference
There are no references for this vulnerability.	

SNMP Default Communities — Medium

Solution Details

Disable SNMP on this host unless it is specifically required for remote management purposes. If SNMP is required, change the SNMP community strings to be complex and difficult for an attacker to guess.

Some sample methods for changing SNMP community strings on common platforms have been provided below. For specific instructions, please consult this host's user manual or contact the vendor of this host for assistance.

Cisco routers:
In Enable mode, type:
'snmp-server community ' to add a specified community string.
'no snmp-server community ' to remove a specified community string.
'no snmp-server' to disable the SNMP server.

HP JetDirect:
The read-only community strings of 'public' and 'internal' can not be changed. These strings are used by the JetAdmin software, and are hard coded into the firmware. Please contact HP directly to find out how to properly secure a HP Printer. It is possible to change the write community string by typing the following via a TELNET session:
set-cmnty-name: NewString
The only valid workaround for this vulnerability on a HP JetDirect printer is to disable SNMP using the following command via TELNET:
snmp-config: 0

Without SNMP, the Embedded WebServer will not function properly, so it is recommended that EWS be disabled using the following command via TELNET: ews-config: 0
SNMP can be disabled in more recent versions of the JetDirect firmware. If this command is not available, please upgrade the printer firmware to the latest available.
Caveats:
In certain devices the SNMP community strings are read-only and thus cannot be changed. In these situations, contact the vendor for the proper procedure to secure the device.

Additionally, changing the SNMP community string will affect management tools which utilize SNMP to remotely manage this host. Please ensure that any such tools have are reconfigured accordingly.
Workarounds:
In some situations, the SNMP community strings are not user configurable. In those cases, utilize other means such as host or network based firewall rules to restrict access to authorized hosts only.

Vulnerability Details

Simple Network Management Protocol is a protocol designed for managing and monitoring network devices such as routers, switches, workstations, and more. SNMP versions 1 and 2 support authentication using "community strings" which is similar to a password which grants access to specific roles based on the community string provided. Most vendors ship devices with pre-defined SNMP community strings for read access and for write access to the device. For example, many vendors use "public" as the pre-configure read only community string.

Attackers use lists of default and well known community strings in combination with brute force attacks to attempt to gain read or read/write access to the devices via SNMP.
Impact:
An attacker can leverage default community strings to manage the remote host. Based on the supplied community string, the attacker will have specific permissions to perform certain tasks. In some cases,

the attacker may only be able to read device statistics and configurations. Given a more privileged community string, an attacker may be able to change the configuration of the device or cause it to take certain actions such as reboot or shut down.

False Positive Notes

This item is not a false positive. Appropriate remediation is required.

CVSS Base Score: 7.5

CVE	https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-1999-0517

SSH Accepts Any Login — Medium

Solution Details

Please disable this SSH server or reconfigure it to not accept arbitrary username and password combinations.

Vulnerability Details

The SSH Server on this host appears to accept any username/password combination as valid. On some SSH servers, this can indicate that a blank username/password combination is considered to be valid by the host system. An attacker can leverage this to gain access to or information about this host.

False Positive Notes

Some SSH servers can behave abnormally or in an unexpected manner. This can give the appearance that the server is accepting any username/password combination as correct.

It is recommended that SSH logins be manually tested to verify their accuracy. There are cases where the abnormal behavior can cause a False Positive.

Threat Scan: Unsigned Software Processes — Medium

Solution Details

The detection of unsigned software running does not necessarily indicate that this software is malicious. Nevertheless, steps should be taken to determine that any detected unsigned software is not malicious. Additionally, if the software is published by a well-known vendor, requests should be made to the vendor to ask that only digitally-signed software is provided.

Vulnerability Details

This asset has one or more processes running that are backed by images that are unsigned. Digital signatures provide a measure of trust that a piece of software came from a specific vendor and that it was not altered after it was published. The majority of malware that executes from an image on disk will not be signed. This detection does not guarantee that the reported unsigned software is malicious, but rather provides a list of items that should be examined closer to determine that they are not malicious. Additionally, best practices suggest that only signed software should run on Windows endpoints.
Impact:
Unsigned software can pose several risks. One is that if you run unsigned software that was downloaded from the Internet, there is a chance that it could have been tampered with if the connection was not encrypted. Additionally, there is no guarantee that it hasn't been tampered with since it was downloaded. An attacker may have gained access to the endpoint and overwritten the binary with their own, or otherwise introduced a backdoor. Software that is digitally signed cannot be tampered with in this way without invalidating the signature and thus alerting you to the fact that the software is not in its original published form.

False Positive Notes

Please note that it is possible that a false positive could occur if the endpoint being scanned is running Windows Vista, Server 2008, or Server 2008 R2 and the file was signed using the Sha-256 algorithm. These versions of Windows have limited support for Sha-256 and expect files to be signed using Sha-1. For example, Frontline uses a Sha-256 algorithm to sign it's binary used to gather threat data. As a result, it may show up in the list of unsigned software processes on these Windows versions, even though it is actually signed.

It is possible to apply a hotfix to add support for Sha-256. To do so, please reference the DigiCert link in the external references section for this vulnerability.

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Threat Scan: Windows Defender Disabled — Medium

Vulnerability Details

Windows Defender is not enabled on this asset.
Impact:
While Windows Defender is disabled, this asset is at an increased risk of being infected with malware.

Solution Details

Enable Windows Defender.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

Zend Recursive Method Denial of Service Medium

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

Stack consumption vulnerability in Zend/zend_exceptions.c in PHP before 5.4.44, 5.5.x before 5.5.28, and 5.6.x before 5.6.12 allows remote attackers to cause a denial of service (segmentation fault) via recursive method calls.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Zoom 'Share Screen' Information Disclosure Vulnerability — Medium

Vulnerability Details

Zoom sometimes allows attackers to read private information on a participant's screen, even though the participant never attempted to share the private part of their screen. When a user shares a specific application window via the Share Screen functionality, other meeting participants can briefly see contents of other application windows that were explicitly not shared. The contents of these other windows can be seen for a short period of time when they overlay the shared window and get into focus. (An attacker can, of course, use a separate screen-recorder application, unsupported by Zoom, to save all such contents for later replays and analysis.) Depending on the unintentionally shared data, this short exposure of screen contents may be a more or less severe security issue.
Impact:
An attacker could leverage this vulnerability to obtain sensitive information in the context of the affected asset.

Solution Details

Refer to External References for a link to the most recent stable version of the Zoom client.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

CVSS Vector: AV:N/AC:L/PR:N/UI:R/S:U/C:L/I:N/A:N

Type	Reference
CVE	https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-2021-28133
URL	https://zoom.us/download
URL	https://zoom.us/docs/en-us/trust/security/security-bulletin.html

Anonymous FTP Enabled — Low

Solution Details

If this FTP server is no longer required, disable the service from the host. Otherwise, the FTP server should be configured to not allow anonymous logins. This can be accomplished by changing the 'ftp' user in /etc/passwd to 'noftp' or remove it entirely. Also, make sure that the ftp user's home directory is owned by root. For Microsoft, disable anonymous FTP through the IIS Internet Service Manager. In the left windowpane select Console Root ->Internet Information Server ->IIS ->Default FTP Site. Right mouse click and go to Properties. Go to the 'Security Accounts' tab and de-select 'Allow Anonymous Connections'.

Caveats:
Caution should be used when editing a sensitive file such as /etc/passwd. This file controls all user login information for the host. If errors are made, it could prevent any user from logging in to the host.

False Positive Notes

This item is not a false positive. Appropriate remediation is required.

Vulnerability Details

The FTP service on this host is configured to allow anonymous access to the server. Anonymous access allows any user to log in remotely to the server without providing a username and password to authenticate. With anonymous access, a remote attacker could potentially log into the FTP server and upload or download data at will.

Impact:
Anonymous access could be used to harbor malicious files for attackers to use in further attacks on the network, or even across the internet. It can also allow attackers to access any sensitive data that may be stored on an FTP server.

CVE	https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-1999-0497

Apache Default Start Page — Low

Vulnerability Details

This host is running Apache web server. The default Apache "It Works!" Page implies this host may not be configured for optimal security. An attacker can leverage this to gain access to or information about this host.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please ensure this host is configured to appropriately restrict access.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Apache HTTP Server mod_cluster Improper Input Validation Vulnerability — Low

Vulnerability Details

Apache HTTP Server mod_cluster before version httpd 2.4.23 is vulnerable to an Improper Input Validation in the protocol parsing logic in the load balancer resulting in a Segmentation Fault in the serving httpd process.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to version 2.4.3 or later.

CVSS Base Score: 4.3

Apache Range Header Denial Of Service — Low

Solution Details

Apache has released version 2.2.20 of the Apache Web Server which addresses this flaw. Apache highly recommends that all users upgrade to this version. Please see the External References section for links to information about this update.

If it is not feasible to upgrade the server due to vendor constraints, several different remediation options have been provided:

1) Use SetEnvIf or mod_rewrite to detect a large number of ranges and then either ignore the Range: header or reject the request.

Option 1: (Apache 2.0 and 2.2)

```
# Drop the Range header when more than 5 ranges.
# CVE-2011-3192
SetEnvIf Range (,.*?){5,} bad-range=1
RequestHeader unset Range env=bad-range

# optional logging.
CustomLog logs/range-CVE-2011-3192.log common env=bad-range
```

Option 2: (Also for Apache 1.3)

```
# Reject request when more than 5 ranges in the Range: header.
# CVE-2011-3192
#
RewriteEngine on
RewriteCond %{HTTP:range} !(^bytes=[^,]+(,[^,]+){0,4}$|^$)
```

RewriteRule .* - [F]

The number 5 is arbitrary. Several 10's should not be an issue and may be required for sites which for example serve PDFs to very high end eReaders or use things such complex http based video streaming.

2) Limit the size of the request field to a few hundred bytes. Note that while this keeps the offending Range header short - it may break other headers; such as sizeable cookies or security fields.

LimitRequestFieldSize 200

Note that as the attack evolves in the field you are likely to have to further limit this and/or impose other LimitRequestFields limits.

See: http://httpd.apache.org/docs/2.2/mod/core.html#limitrequestfieldsize

3) Use mod_headers to completely dis-allow the use of Range headers:

RequestHeader unset Range

Note that this may break certain clients - such as those used for e-Readers and progressive/http-streaming video.

4) Deploy a Range header count module as a temporary stopgap measure:

http://people.apache.org/~dirkx/mod_rangecnt.c

Precompiled binaries for some platforms are available at:

http://people.apache.org/~dirkx/BINARIES.txt

5) Apply any of the current patches under discussion - such as:

http://mail-archives.apache.org/mod_mbox/httpd-dev/201108.mbox/%3cCAAPSnn2PO-d-C4nQt_TES2RRWiZr7urefhTKPWBC1b+K1Dqc7g@mail.gmail.com%3e

Vulnerability Details

The Apache web server running on this host appears to be susceptible to a denial of service condition. Apache versions 1.3.x and 2.x are all vulnerable to malicious requests which attempt to set the Range header with multiple overlapping byte ranges. Under normal conditions, a client may use the Range header to specify the number of bytes to receive a chunk of large data in. When an attacker modifies this to include many different byte ranges, the Apache web server will attempt to process all of them and consume all memory resources which can lead to system instability, process shutdown, and complete denial of service.
Impact:
By opening a moderate amount of connections to the vulnerable Apache web server, an attacker may be able to cause Apache to consume all memory resources on the affected server. This will result in system instability and eventually complete denial of service. This attack does not require the amount of bandwidth that a typical distributed denial of service attack would utilize. Therefore, it is extremely important to resolve this flaw by either upgrading or applying one of the workarounds provided.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Apache Tomcat End of Life — Low

Solution Details

Upgrade to a supported version of Apache Tomcat.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

The version of Apache Tomcat on this host is no longer supported. Vulnerabilities within this version of Apache Tomcat will no longer be fixed by Apache.
Impact:
Even though vulnerabilities in this version of Apache Tomcat may exist, Apache will not patch them. Should any vulnerabilities exist, an attacker might be able to leverage them to gain unauthorized access to this host or its data.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

URL	http://tomcat.apache.org/tomcat-55-eol.html
URL	http://tomcat.apache.org/whichversion.html

Apache Username Disclosure — Low

Vulnerability Details

This host is running the Apache web server with the UserDir feature enabled. It is possible to enumerate users by requesting a URL such as '/~username', a 200 OK or 403 FORBIDDEN response will indicate that account exists on this host, whereas a 404 NOT FOUND or 500 INTERNAL ERROR will indicate the given username is not valid. An attacker can leverage this to gain access to this host.

False Positive Notes

This item is not a false positive. Appropriate remediation is required.

Solution Details

Within the httpd.conf file for this Apache web server, change the 'UserDir public_html' directive to 'UserDir disabled' and restart the web server.

CVSS Base Score: 5

Debian End of Life — Low

Vulnerability Details

This host is running a version of Debian Linux which is no longer supported. Vulnerabilities associated with this version of Debian cannot be guaranteed to be patched.
Impact:
Unsupported versions of Debian will no longer get updates. Because of this, the OS can be susceptible to vulnerabilities identified in other versions of Debian without any chance of being remediated.

Solution Details

If this asset is required for production, please upgrade the operating system and ensure it is fully patched.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

HTTP Host Header Value Reflection — Low

Manual Exploitation

Using the Instance Data in the vulnerability and host information in frontline, you can reproduce the vulnerability as follows.

Example:

Vulnerable asset: 127.0.0.1
Vulnerability found on port: 80

Instance data (portion before the colon is the vulnerable path found. Portion after was the vulnerable match we located)

/bad_page.html : a href="http://vm.frontline.com/new_page.htm>Click here</a>

Based off of this you can manually test it as follows with the vulnerable path being "/bad_page.html".

```
curl -H "Host: vm.frontline.cloud" http://127.0.0.1/bad_page.html
```

"Host: vm.frontline.cloud" is a fake Host header sent with the request and is what to look for returned in the response. Alternatively you can use another hostname such as example.com.

The response received is then searched for the "Host:" url that was sent to see if there are urls in the body of the response that got replaced by it. "a href="http://vm.frontline.com/new_page.htm>Click here</a>" is the link found in the example instance data.

Vulnerability Details

This asset is running a web server service which is hosting an application which reflects the user-supplied Host Header value in the response body. This can lead to XSS and cache poisoning attacks.
Impact:
A remote attacker could leverage this vulnerability to perform XSS, XXE, Cache Poisoning, and other attacks.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Ensure that user-supplied data and header values are not directly used without filtering and validation, especially before being used in a response body.

CVSS Base Score: 0

HTTP XML Injection — Low

Solution Details

Ensure that all user supplied input is sanitized for XML escape and control characters. Typical characters which must be sanitized include single quote, double quote, and left and right angle brackets. Please note you should use XML escaping routines to sanitize data instead of manually applying regular expressions to escape individual characters.

Vulnerability Details

This host's web application is vulnerable to an XML injection whereby user supplied input may be inserted and parsed by an XML parser on the web server.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Insecure Crossdomain.xml Directives — Low

Solution Details

Please limit cross-domain access to evaluated and specified sites. See Adobe's recommendations for cross-domain policies at the appropriate link listed in the References List.

Vulnerability Details

This host's URL policy file, crossdomain.xml, allows cross-domain requests from any host. An attacker can leverage this flaw to perform other attacks such as cross-site scripting or cross-site request forgery.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.8

Insecure HTML5 Cross Origin Request Policy — Low

Vulnerability Details

This host has one or more pages that contain the Access-Control-Allow-Origin header set to "*", which allows cross-domain requests from any host.
Impact:
An attacker can leverage this flaw to perform other attacks such as cross-site scripting or cross-site request forgery.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please limit cross-domain access to evaluated and specified sites.

Manual Exploitation

This can be tested with the following commands:
Non-SSL:
"curl -I "http://<IP_Address>:<port><path>"
SSL:
"curl -I -k "https://<IP_Address>:<port><path>"

The IP Address is the IP Address of the host. May also be the domain name if thats how the host was scanned.

The Port is the port listed on the right side of the vulnerability trigger.

The Path is listed in the vulnerability trigger details.

You will use the SSL option if underneath the port it has "(SSL)".

If the response has "Access-Control-Allow-Origin: *", this is a legitimate trigger.

Microsoft Windows Service Pack Outdated

Low

Solution Details

Please run Windows Update on this host to obtain the latest service pack.

Vulnerability Details

This host does not appear to have the latest supported Microsoft Windows service pack installed. Service pack updates ensure that the system meets some base level of patching and typically contain security enhancements to the base operating system that are not otherwise available as single-security-patches. Vulnerabilities existing on hosts with outdated Windows Service Packs are often much easier to leverage into full system compromises.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

MS09-048 Microsoft Windows TCP/IP Remote Code Execution Vulnerabilities

Low

Solution Details

Please apply Microsoft patch MS09-048 to this host. Note: There is no patch for Windows 2000 or Windows XP hosts. According to Microsoft, Windows XP Service Packs 2 and 3 are not affected by these vulnerabilities due to the client firewall not having a listening service. In Windows 2000, the vulnerability is found in the kernel of the operating system, instead of the system libraries. This makes it "infeasible to build the fix for Microsoft Windows 2000 Service Pack 4 to eliminate the vulnerability."

Caveats:
Installing patches can change the functionality and the stability of the host. It is advised that any patches be thoroughly tested and approved before installing on a production system.

Workarounds:
As there is no update for Windows XP or Windows 2000 hosts, ensure firewall best practices are in use. Internet facing hosts should have a minimal number of ports exposed. If possible, enable advanced TCP/IP filtering.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This host is missing Microsoft patch MS09-048. This patch covers three vulnerabilities that affect the

TCP/IP stack in Microsoft Windows.

Certain installations of Microsoft Windows incorrectly process certain packets that have a very small, or zero, window size. Because of this flaw, hosts can become non-responsive or can automatically restart. An attacker can leverage this flaw to cause a denial of service condition.

Next, these installations can improperly clean up state information after processing packets with invalid timestamps. This data can later be referenced by the TCP/IP stack as a function pointer, causing the service to crash. An attacker can leverage this flaw to cause a denial of service, or to cause the service to reference another segment of memory, potentially yielding control of the remote system to the attacker.

Finally, these installations are susceptible to a second denial of service condition. If an application closes a TCP connection with pending data to be sent and an attacker has set a small or zero TCP receive window size, the affected server will not be able to completely close the TCP connection. The attacker can flood the host with these specially crafted packets and cause the affected system to stop responding to new requests.

Impact:
By not applying this patch, this host remains in a vulnerable state. An attacker could force this host to restart repeatedly, or potentially take full control.
Caveats:
This CVC detects the absence of the patch on Windows 2000 and Windows XP Hosts only.

CVSS Base Score: 10

MS22-MAY: Microsoft .NET Security Update — Low

Solution Details

Microsoft has released a fix for this flaw in their May 2022 Security Update. Please download and install the patch from the Microsoft Update Catalog or run Windows Update on the affected asset.

Vulnerability Details

Microsoft has released a security update for Microsoft .NET Framework which includes fixes for the following vulnerabilities:

CVE-2022-30130 - .NET Framework Denial of Service Vulnerability

Affected Products:
Microsoft .NET Framework 3.5 AND 4.6.2/4.7/4.7.1/4.7.2 on Windows 10 Version 1607 for x64-based Systems
Microsoft .NET Framework 4.8 on Windows Server 2012 R2
Microsoft .NET Framework 3.5.1 on Windows Server 2008 R2 for x64-based Systems Service Pack 1 (Server Core installation)
Microsoft .NET Framework 4.8 on Windows Server 2016
Microsoft .NET Framework 3.5 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 3.5 AND 4.8 on Windows 10 Version 1809 for 32-bit Systems
Microsoft .NET Framework 3.5 AND 4.6.2/4.7/4.7.1/4.7.2 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 3.5 on Windows Server 2012
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.2 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 4.6 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 3.5 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.2 on Windows Server 2012 R2
Microsoft .NET Framework 4.8 on Windows 10 Version 1607 for x64-based Systems
Microsoft .NET Framework 3.5 AND 4.7.2 on Windows 10 Version 1809 for x64-based Systems
Microsoft .NET Framework 3.5 AND 4.8 on Windows 10 Version 20H2 for ARM64-based Systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.2 on Windows Server 2012
Microsoft .NET Framework 4.8 on Windows 10 Version 21H2 for x64-based Systems
Microsoft .NET Framework 4.8 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 4.6/4.6.1/4.6.2/4.7/4.7.1/4.7.2 on Windows Server 2012 (Server Core installation)
Microsoft .NET Framework 4.8 on Windows 8.1 for x64-based systems
Microsoft .NET Framework 4.6 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 3.5 AND 4.7.2 on Windows Server 2019 (Server Core installation)
Microsoft .NET Framework 3.5 on Windows 8.1 for 32-bit systems
Microsoft .NET Framework 4.8 on Windows Server 2012
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for 32-bit Systems Service Pack 2
Microsoft .NET Framework 3.5 AND 4.7.2 on Windows 10 Version 1809 for 32-bit Systems
Microsoft .NET Framework 3.5 AND 4.8 on Windows 10 Version 1909 for ARM64-based Systems
Microsoft .NET Framework 3.5 on Windows Server 2012 R2
Microsoft .NET Framework 4.8 on Windows 10 Version 1607 for 32-bit Systems
Microsoft .NET Framework 4.8 on Windows Server 2012 R2 (Server Core installation)
Microsoft .NET Framework 4.8 on Windows 7 for x64-based Systems Service Pack 1
Microsoft .NET Framework 3.5 AND 4.8 on Windows Server 2019
Microsoft .NET Framework 3.0 Service Pack 2 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 2.0 Service Pack 2 on Windows Server 2008 for x64-based Systems Service Pack 2
Microsoft .NET Framework 3.5 AND 4.8 on Windows 10 Version 1809 for x64-based Systems
Microsoft .NET Framework 4.8 on Windows 10 Version 21H1 for 32-bit Systems
Microsoft .NET Framework 3.5 AND 4.7.2 on Windows Server 2019
Microsoft .NET Framework 3.5 AND 4.6.2/4.7/4.7.1/4.7.2 on Windows Server 2016

NetBIOS Shares With Everyone/Full-Control Permissions — Low

Solution Details

Please remove the 'Everyone' group from the list of users allowed to access this file share.

Vulnerability Details

This host is sharing Windows folders with Full-Control (READ/WRITE) access with the special Windows group of 'EVERYONE'. This Windows group encompasses any user with a valid logon on the domain, no matter how minor their permissions.

Many major computer worms including, Conficker, Stuxnet, and Rorpian utilize shares with 'Everyone' access to write booby-trapped files which spread the infection to other windows hosts which may access these folders.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

URL	http://support.microsoft.com/kb/314984

OpenSSH Local Information Disclosure Vulnerability — Low

Vulnerability Details

authfile.c in sshd in OpenSSH before 7.4 does not properly consider the effects of realloc on buffer contents, which might allow local users to obtain sensitive private-key information by leveraging access to a privilege-separated child process.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Please upgrade to the most recent stable release of OpenSSH, available at http://www.openssh.org.

CVSS Base Score: 2.1

CVSS Vector: AV:L/AC:L/Au:N/C:P/I:N/A:N

OpenSSH scp Client Access Bypass Vulnerability — Low

Solution Details

Please refer to the External References for a link to upgrade to the most recent stable version of OpenSSH.

Vulnerability Details

In OpenSSH 7.9, scp.c in the scp client allows remote SSH servers to bypass intended access restrictions via the filename of . or an empty filename. The impact is modifying the permissions of the target directory on the client side.
Impact:
An attacker can exploit this issue to bypass certain security restrictions and perform unauthorized actions; this may aid in launching further attacks.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

OpenSSH Security Advisory — Low

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

An issue was discovered in OpenSSH before 8.9. If a client is using public-key authentication with agent forwarding but without -oLogLevel=verbose, and an attacker has silently modified the server to support the None authentication option, then the user cannot determine whether FIDO authentication is going to confirm that the user wishes to connect to that server, or that the user wishes to allow that server to connect to a different server on the user's behalf.

Solution Details

Update to the most recent stable version of OpenSSH.

CVSS Base Score: 3.7

URL	https://www.openssh.com/

OpenSSH 'sshd' Monitor Component Local Impersonation Vulnerability — Low

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

Vulnerability Details

The monitor component in sshd in OpenSSH before 7.0 on non-OpenBSD platforms accepts extraneous username data in MONITOR_REQ_PAM_INIT_CTX requests, which allows local users to conduct impersonation attacks by leveraging any SSH login access in conjunction with control of the sshd uid to send a crafted MONITOR_REQ_PWNAM request, related to monitor.c and monitor_wrap.c.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 1.9

OpenSSL AES-NI CBC Padding Oracle Attack — Low

Solution Details

Update to the latest version of OpenSSL.

Vulnerability Details

Older versions of OpenSSL, before 1.0.1t and 1.0.2 before 1.0.2h, do not properly implement AES-NI. During a certain padding check, the vulnerable implementation does not consider memory allocation, which allows remote attackers to obtain sensitive cleartext information via a padding-oracle attack against an AES CBC session.
Impact:
An attacker can use this flaw to decrypt some ciphertext, potentially exposing sensitive information.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 2.6

CVSS Vector: AV:N/AC:H/Au:N/C:P/I:N/A:N

OpenSSL End of Life — Low

Solution Details

Upgrade to a supported version of OpenSSL.

Vulnerability Details

The version of OpenSSL running on this host is no longer supported. Vulnerabilities within this version of OpenSSL will no longer be fixed .
Impact:
Even though vulnerabilities in this version of OpenSSL may exist, they will not be patched. Should any vulnerabilities exist, an attacker might be able to leverage them to gain unauthorized access to this host or its data.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

PHP End of Life — Low

Solution Details

Upgrade to a currently supported version of PHP.

Vulnerability Details

The installed version of PHP has reached "End-of-Life" status. This means PHP is no longer releasing updates or supporting this version of PHP. Any vulnerabilities present in this version of PHP will not be patched by PHP.
Impact:
Even though vulnerabilities in this version of PHP may exist, PHP will not patch them. Should any vulnerabilities exist, an attacker might be able to leverage them to gain unauthorized access to this host or its data.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

PHP 'ext/standard/info.c' Sensitive Information Disclosure — Low

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

The phpinfo implementation in ext/standard/info.c in PHP before 5.4.30 and 5.5.x before 5.5.14 does not ensure use of the string data type for the PHP_AUTH_PW, PHP_AUTH_TYPE, PHP_AUTH_USER, and PHP_SELF variables, which might allow context-dependent attackers to obtain sensitive information from process memory by using the integer data type with crafted values, related to a "type confusion" vulnerability, as demonstrated by reading a private SSL key in an Apache HTTP Server web-hosting environment with mod_ssl and a PHP 5.3.x mod_php.
Impact:
An attacker could obtain sensitive information from process memory.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 2.6

CVSS Vector: AV:N/AC:H/Au:N/C:P/I:N/A:N

PHP 'gdImageColorMatch' Buffer Overflow Vulnerability — Low

Solution Details

Refer to the External References section for a link to upgrade to the most recent stable version of PHP.

Vulnerability Details

gdImageColorMatch in gd_color_match.c in the GD Graphics Library (aka LibGD) 2.2.5, as used in the imagecolormatch function in PHP before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14, and 7.3.x before 7.3.1, has a heap-based buffer overflow. This can be exploited by an attacker who is able to trigger

imagecolormatch calls with crafted image data.
Impact:
An attacker can exploit these issues to execute arbitrary code in the context of the user running the affected application. Failed exploit attempts will likely result in denial-of-service conditions.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 6.8

CVSS Vector: AV:N/AC:M/Au:N/C:P/I:P/A:P

Phpinfo.php System Information Disclosure — Low

Solution Details

Inside of the php.ini file, change the line that includes the "disable_functions" directive to include "phpinfo".

Example:
disable_functions = phpinfo

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This host is running a third-party web content program. Several third-party web content vendors (including Zend, Invision, and Mambo) include a publicly available script in the web root named 'phpinfo.php'. Any user of the website can view this file, which contains sensitive information about the web server itself, such as environment variables, directory information, and user names. An attacker can leverage this information to help focus his attacks.

CVSS Base Score: 2.6

CVSS Vector: AV:N/AC:H/Au:N/C:P/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

PHP PEAR_REST Arbitrary File Write Vulnerability — Low

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

The PEAR_REST class in REST.php in PEAR in PHP through 5.6.0 allows local users to write to arbitrary files via a symlink attack on a (1) rest.cachefile or (2) rest.cacheid file in /tmp/pear/cache/, related to the retrieveCacheFirst and useLocalCache functions.
Impact:
A local attacker could use this flaw to perform a symbolic link attack against a user (typically the root user) running a pear command (such as "pear install").

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 3.6

CVSS Vector: AV:L/AC:L/Au:N/C:N/I:P/A:P

URL	http://php.net/downloads.php
URL	https://cwe.mitre.org/data/definitions/59.html

PHP 'PHP-FPM' Information Disclosure Vulnerability — Low

Vulnerability Details

An issue was discovered in PHP before 5.6.35, 7.0.x before 7.0.29, 7.1.x before 7.1.16, and 7.2.x before 7.2.4. Dumpable FPM child processes allow bypassing opcache access controls because fpm_unix.c makes a PR_SET_DUMPABLE prctl call, allowing one user (in a multiuser environment) to obtain sensitive information from the process memory of a second user's PHP applications by running gcore on the PID of the PHP-FPM worker process.
Impact:
An attacker could learn valuable information about the target asset that could aid in future attacks.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

CVSS Base Score: 1.9

CVSS Vector: AV:L/AC:M/Au:N/C:P/I:N/A:N

PHP '/tmp/phpglibccheck' File Overwrite Vulnerability — Low

Solution Details

Upgrade to the most recent stable version of PHP. Refer to the External References section for more information.

Vulnerability Details

acinclude.m4, as used in the configure script in PHP 5.5.13 and earlier, allows local users to overwrite arbitrary files via a symlink attack on the /tmp/phpglibccheck file.
Impact:
A symlink attack could be launched against the running ./configure script.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 3.3

CVSS Vector: AV:L/AC:M/Au:N/C:N/I:P/A:P

There are no references for this vulnerability.	

Protocol Allows Authentication Over Clear Text — Low

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Use an encrypted version of this service. The following table provides some examples of services which do authentication over clear text and their encrypted secure counterparts:

ftp -> sftp
telnet -> ssh
imap -> imaps
pop3 -> pop3s

Vulnerability Details

This host is running a service which performs authentication in an insecure manner over clear text.
Impact:
An attacker could utilize a variety of methods to intercept the authentication exchange and gain access to this host.
Caveats:
Depending on the authentication mechanism used, the attacker may not be able to extract the clear text username and/or password.

CVSS Base Score: 3.3

CVSS Vector: AV:A/AC:L/Au:N/C:P/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Quote Of The Day Service — Low

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Unless it is required, please disable 'qotd'.
This can be done on Unix-based machines by 'commenting out' the qotd entry in the /etc/inetd.conf file by placing a '#' in front of the qotd line and restarting inetd ('killall -HUP inetd').
On Windows machines, click 'Start' - 'Control Panel' and double click 'Administrative Tools' - 'Services'. Scroll down and right-click on 'Simple TCP/IP Services' and select 'Properties'. Under the 'General' tab, change the startup type to 'Manual', then click the 'Stop' button under 'Service Status' and click 'OK'. Note that this will also disable the 'Echo', 'Discard', 'Character Generator', and 'Daytime' service (all of which are unnecessary services).

Vulnerability Details

This host is running the Quote of the Day service. This service provides no functionality other than printing out various quotes. This service can be leveraged to create a DoS condition.

CVSS Base Score: 5

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:P

Slowloris Resource Depletion And Denial Of Service | Low

Solution Details

This attack can be mitigated by; 1) limiting the number of inactive concurrent web server connections a single user may be allowed to maintain, or 2) setting a minimum threshold of data per second a web server connection is allowed to maintain without being dropped.

Examples of applicable apache modules useful for implementing suggested remediation include:
mod_reqtimeout - http://httpd.apache.org/docs/2.3/mod/mod_reqtimeout.html
mod_qos - http://sourceforge.net/projects/mod-qos/
mod_cband - http://cband.linux.pl
mod_limitpconn - http://dominia.org/djao/limitipconn.html
mod_evasive - http://www.networkdweebs.com/stuff/security.html
mod_security - http://www.modsecurity.org/
mod_antiloris - ftp://ftp.monshouwer.eu/pub/linux/mod_antiloris/

Additional third party modules may also be available. Please contact the vendor for additional information.

Vulnerability Details

This host is running a web server that appears to utilize a configuration which allows a single remote host to consume all connection resources. The slowloris denial of service is achieved by systematically establishing and maintaining connections through partial header requests and http keepalive messages. The attacker can continue this methodology until all web server connections are tied up, resulting in a complete denial of service to legitimate users. Web servers that utilize threading are more susceptible to a slowloris attack. In contrast to other web server denial of service techniques, this attack only requires a tiny amount of bandwidth and a single host IP address.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

SMB Security Signatures Not Required — Low

Solution Details

In order to remediate this vulnerability, you must require SMB signing on both clients and servers. The most effective way to require SMB signing is by making the following changes to your domain group policy:

Microsoft network client: Digitally sign communications (always) Policy Setting: Enabled

Microsoft network server: Digitally sign communications (always) Policy Setting: Enabled

Please note that this setting may cause issues with third-party applications and devices, such as multi-function copiers/printers and some versions of MacOS, from properly authenticating to your domain if they do not support SMB signing. We recommend placing these types of devices in a separate domain group in which SMB signing is not required.

For a generic overview of SMB signing, please consult the following links:
https://blogs.technet.microsoft.com/josebda/2010/12/01/the-basics-of-smb-signing-covering-both-smb1-and-smb2/
https://docs.microsoft.com/en-us/windows/security/threat-protection/security-policy-settings/microsoft-network-client-digitally-sign-communications-always
https://docs.microsoft.com/en-us/windows/security/threat-protection/security-policy-settings/microsoft-network-server-digitally-sign-communications-always

For Linux, use the following setting in smb.conf in the [global] section. File typically located at /etc/samba/smb.conf.

```
client signing = mandatory
server signing = mandatory
```

Vulnerability Details

This host does not appear to require SMB Security Signatures when communicating with peers. When SMB signing is required, both computers in the SMB connection must support SMB signing. SMB Security Signatures provide a more secure communication path on Microsoft Windows Domains by ensuring that authenticated session messages cannot be relayed by a man-in-the-middle attacker.

By intercepting challenge/response sequences, a remote unauthenticated attacker may be able obtain session keys which can be used to authenticate to the domain controller with the privileges of the affected user.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 3.2

CVSS Vector: AV:A/AC:H/Au:N/C:P/I:P/A:N

URL	https://support.microsoft.com/en-us/help/887429/overview-of-server-message-block-signing

SMB User Enumeration — Low

Solution Details

If this host does not need to share resources (file/printer sharing, RPC, etc.), disable the Server Service. By disabling the Server Service, the machine can still participate in a domain, but will no longer allow it's resources to be shared on the network (i.e. an attached printer, fixed disks, etc.). If this host is accessible externally, we recommend that access be filtered to TCP ports 135, 138, 139, and 445 as well as UDP ports 137, 138, and 139.

Vulnerability Details

This host is running a Samba server with SMB NULL sessions enabled, which was used to obtain a list of the users on this host. Please see the Data Section for the list of users that was retrieved.
Impact:

SMB NULL sessions allow an attacker to query for the usernames of accounts on this host. Once an attacker has the account names, it may be possible to launch brute force or password guessing attacks.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

SMTP Server EXPN/VRFY — Low

Solution Details

For Sendmail; in /etc/sendmail.cf add the option 'O PrivacyOptions=goaway'.
For other vendors; refer to the application documentation, or contact the vendor for proper settings.

Vulnerability Details

This host is running a SMTP mail server that answers to the EXPN and/or VRFY commands. The EXPN command can be used to find the delivery address of mail aliases, or even the full name of the recipients. The VRFY command may be used to check the validity of an account. An attacker can leverage these commands to gather information about user accounts for use in brute force attacks or social engineering.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

SSH Protocol 1 Enabled — Low

Vulnerability Details

This host accepts Secure Shell (SSH) connections that are encrypted using version 1 of the SSH protocol (SSH-1). Several cryptographic weaknesses are inherent in SSH-1, which make it unsuitable for use in a production environment. These weaknesses include the recovery of a session key as well as susceptibility to the CRC32 Compensation Attack Detector. Exploitation of either of the mentioned

attack vectors can result in complete compromise of the vulnerable server.
Impact:
If a host is running an SSH server that supports SSH-1, users of the system can compromise the security of the system by being subjected to a man-in-the-middle attack. An attacker who is able to eavesdrop on the communication between the client and the server will be able to replay packets, discover the session key, or otherwise submit legitimate requests to the SSH-1 server under the context of the connecting client who is being exploited.

The extent of the impact of this attack will depend on the privileges of the user who is exploited by an attacker.

False Positive Notes

This item is not a false positive. Appropriate remediation is required.

Manual Exploitation

A command of the following form will establish a connection from the localhost to a remote machine on standard command-line SSH tools:

```
ssh -1 <username>@<remotehostname or IP address>
```

```
e.g. ssh -1 jsmith@192.168.0.3
```

That command will attempt to establish a session over SSH-1 with the remote host that has IP address 192.168.0.3 using the username 'jsmith'.

Solution Details

It is recommended that use of SSH-1 be disabled on the vulnerable server.

In OpenSSH implementations, this can be accomplished by modifying the sshd_config file on the server. Change the 'Protocol' option to read 'Protocol 2' and remove any other 'Protocol' option lines from the sshd_config file.

CVSS Base Score: 7.5

SSL Connection: RSA Export Grade Cipher FREAK Vulnerability — Low

Solution Details

To fix this vulnerability, disable all SSL export grade ciphers listed in the data section of this vulnerability.

For Apache Servers:
Add the "!EXP" directive to the "SSLCipherSuite" setting in the httpd.conf file.

For IIS Servers:
See KB-Item KB245030 (linked in the references section) and disable all ciphers with "EXPORT" in the name.

Vulnerability Details

This server allows for encrypted connections using RSA Export grade ciphers, allowing Man in the Middle attackers to conduct 'SSL FREAK' (Factoring Attack on RSA-EXPORT Keys) attacks which can result in all encrypted traffic between this server and affected clients to be decrypted in a brute-force fashion.

Because modern web servers often don't generate fresh RSA keys for every single connection, and will often generate them on startup and use them so long as the server remains running, this can cause a single factored RSA key attack carried out against a single client to be reused to affect other current and future connections to the server (until it is restarted).

Recent vulnerability disclosures in SSL implementations indicate that this attack is often available even if the client claims to reject SSL-Export-Grade ciphers which is why it must be disabled on the server to ensure that the confidentiality of encrypted connections is maintained.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

SSL Connection: Server Appears Vulnerable to ChangeCipherSpec Injection

Low

Vulnerability Details

This host is running a web server which is utilizing a version of OpenSSL that appears to be susceptible to a change cipher spec injection vulnerability. This vulnerability is a flaw in the implementation of OpenSSL that may allow an attacker to observe connection content between a client and this server via a man-in-the-middle type of attack.

This vulnerability affects all current SSL protocol versions, including: SSL3.0, TLS1.0, TLS1.1, TLS1.2.

Please be aware that this is an experimental vulnerability check. If the scanner indicates that your server may allow early CCS, you need to still confirm that the target is in fact OpenSSL in the affected range as outlined in the OpenSSL security advisory.
Impact:
An attacker who exploits this vulnerability must utilize a man-in-the-middle attack in order to get any benefit from the vulnerability. As a result of this, the severity of this vulnerability is considered much lower than that of the OpenSSL Heartbleed flaw. This is generally the case when the web server is only accessible via the local network. However, if a server is accessible via the Internet, the severity increases somewhat as there is a greater potential for a man-in-the-middle attack.

Regardless of whether the server is exposed internally or externally, if an attacker is able to obtain a privileged position between a client and this server, it may be possible to read all sensitive data that is passing between the two hosts by abusing this flaw.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

This vulnerability is reported to affect versions of OpenSSL including:

OpenSSL 1.0.1 through 1.0.1g
OpenSSL 1.0.0 through 1.0.0l
all versions before OpenSSL 0.9.8y

Non-affected versions include:

OpenSSL 1.0.1h
OpenSSL 1.0.0m
OpenSSL 0.9.8za

OpenSSL has released updated versions of the library that address this vulnerability. Please upgrade to the latest version.

CVSS Base Score: 5.8

SSL Connection: Server Vulnerable to Bar Mitzvah Attack — Low

Solution Details

Disable support for the RC4 cipher suites in favor of TLS 1.2 AES-GCM cipher suites. Consult your specific vendor documentation for more information.

Vulnerability Details

The RC4 algorithm, as used in the TLS protocol and SSL protocol, does not properly combine state data with key data during the initialization phase. This makes it easier for remote attackers to conduct plaintext-recovery attacks against the initial bytes of a stream by sniffing network traffic that occasionally relies on keys affected by the Invariance Weakness, and then using a brute-force approach involving LSB values. This is also known as the "Bar Mitzvah" issue.
Impact:
A successful attack against a TLS/SSL session that uses the RC4 cipher could result in a leak of a limited amount of plaintext such as user credentials.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

SSL Connection: SSLv3 CBC Mode Cipher POODLE Vulnerability — Low

Vulnerability Details

This host is susceptible to the SSL version 3 POODLE (Padding Oracle On Downgraded Legacy Encryption) attack. By using SSL version 3 and CBC Mode ciphers this host can allow an attacker to expose encrypted data in a connection between the client and server.
Impact:
Over time, an attacker can steal sensitive information between the client and the server using this man in the middle attack. Hosts may default to a more secure protocol (TLS 1.2, for example), but a network attacker could potentially trigger a reconnection causing the browser to retry older protocols (SSL version 3).

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

It is recommended that SSL 3.0 be disabled to avoid this and other related vulnerabilities. However, due to backwards compatibility concerns, it may be necessary to leave this protocol enabled. In this case disabling CBC ciphers will also prevent this attack. It is also recommended that the client and server be updated to support the TLS_FALLBACK_SCSV mechanism. This ensures that SSL 3.0 is only used in legacy situations, and prevents attackers from forcing a protocol downgrade.

SSL Connection: SSL Version 3 Enabled — Low

Vulnerability Details

This host appears to support Secure Sockets Layer version 3 (SSLv3). The National Institute of Standards and Technology (NIST) has identified SSLv3 as “no longer being acceptable for protection of data due to inherent weaknesses within the protocol." This is in large part due to the many reported vulnerabilities within various implementations of SSLv3, including high profile vulnerabilities such as Heartbleed and POODLE.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Due to its inherent weaknesses, please consider disabling support for SSLv3 and only supporting Transport Layer Security (TLS) version 1.2. Consult your specific vendor documentation for more information.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

SSL Connection: TLS Diffie-Hellman Export Cipher Downgrade Logjam Vulnerability — Low

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Disable export grade cipher suites, generate a unique 2048-bit or stronger Diffie-Hellman group, and enable Elliptic-Curve Diffie-Hellman (ECDHE) cipher suites. For more specific remediation instructions, refer to the product's documentation or contact the vendor for support.

Vulnerability Details

This server allows encrypted connections using a TLS export grade cipher suite that uses the Diffie-Hellman key exchange algorithm. This allows a man-in-the-middle attacker to conduct the "Logjam" attack on the connection to decrypt the traffic.
Impact:
This server allows encrypted connections using a TLS export grade cipher suite that uses the Diffie-Hellman key exchange algorithm. This allows a man-in-the-middle attacker to conduct the "Logjam" attack on the connection to decrypt the traffic.

Ubuntu End of Life — Low

Vulnerability Details

This host is running a version of Ubuntu Linux which is no longer supported. Vulnerabilities associated with this version of Ubuntu cannot be guaranteed to be patched.
Impact:
Unsupported versions of Ubuntu will no longer get updates. Because of this, the OS can be susceptible to vulnerabilities identified in other versions of Ubuntu without any chance of being remediated.

Solution Details

If this host is required for production, please upgrade the operating system and ensure it is fully patched.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

VNC Weak Password Encryption — Low

Vulnerability Details

This host is running VNC. VNC contains a security flaw. This version does not support strong encryption of the VNC password which is stored in the registry. This password is encrypted using a static key for an encryption algorithm that is easily crackable in a matter of seconds, and is stored in a registry key that by default has no restrictions on user access. An attacker can leverage this security flaw to retrieve the encrypted password hash and crack it to obtain the VNC password.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Remove this installation of VNC. If remote administration is required, install the Enterprise version of VNC and configure it to use strong encryption and authentication controls or use another product that supports strong encryption and authentication mechanisms.

CVSS Base Score: 3.5

CVSS Vector: AV:L/AC:H/Au:S/C:P/I:P/A:P

Type	Reference
There are no references for this vulnerability.	

Web Server Directory Indexing Enabled

Low

Vulnerability Details

This host's web service has directory indexing enabled, which may expose the location of sensitive files. Attackers can leverage this information to target further attacks.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Disable this feature on production servers.
For Apache, remove the 'Indexes' item from the 'Options' configuration line for the appropriate directory and restart the service.

For IIS, open the Internet Service Manager, right-click the appropriate directory, select Properties, and uncheck the 'Indexes' item.

For other web servers, please refer to the vendor documentation.

CVSS Base Score: 10

CVSS Vector: AV:N/AC:L/Au:N/C:C/I:C/A:C

Type	Reference
CVE	https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-1999-0569
URL	https://cwe.mitre.org/data/definitions/200.html

Webserver Expect Header Allows Cross-Site Scripting

Low

Solution Details

Several vendors have provided patches for this flaw.

IBM HTTP Server:
6.0 series: upgrade to version 6.0.2.13 or later
6.1 series: upgrade to version 6.1.0.1 or later

Apache:
2.0 series: upgrade to version 2.0.58 or later
2.2 series: upgrade to version 2.2.2 or later

If neither of these solutions are applicable, please contact the vendor of your web server software for specific remediation instructions.

Vulnerability Details

This host is running a web server that allows reflected cross-site scripting through the Expect HTTP header. An attacker can exploit this flaw by getting the victim's web browser to send a web request to the target web server (this host) with script code in the Expect HTTP header, which will then be reflected back to the victim's web browser and executed. Possible scenarios for this attack include crafted flash files or document files.
Impact:
An attacker that successfully exploits this flaw will be able to run arbitrary script code within the context of the victim's web browser.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

Web Server Uses Unencrypted/Plaintext Form Password Fields — Low

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Utilize HTTPS for all forms which post sensitive information to the web server.

Vulnerability Details

This host contains a webpage with a security flaw. A form on the webpage is submitting passwords over an insecure protocol such as HTTP rather than HTTPS.
Impact:
An attacker cannot normally leverage this flaw to gain access to the host itself. However, this flaw may be used to intercept authentication credentials passed in plain text which then may be used to access the application.

CVSS Base Score: 2.6

CVSS Vector: AV:N/AC:H/Au:N/C:P/I:N/A:N

URL	https://cwe.mitre.org/data/definitions/522.html

WordPress Unsupported Version — Low

Solution Details

Update to the latest stable version of WordPress.

Vulnerability Details

This asset appears to be hosting a version of WordPress which is no longer supported.
Impact:
Even though vulnerabilities in this version of WordPress may exist, they will likely not be patched. Should any vulnerabilities exist, an attacker might be able to leverage them to gain unauthorized access to this host or its data.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Apache ETags Inode Number Disclosure

Trivial

Vulnerability Details

This instance of Apache HTTP Server discloses file inode numbers via the ETag header, and child process IDs (PID) via multipart MIME boundaries.
Impact:
A remote attacker could utilize this information disclosure to focus future attacks.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Apply the ETags directive excluding the Inodes field to your apache.conf, as below

```
<Directory />
...
...
FileETag
...
</Directory>
```

CVSS Base Score: 4.3

Apache HTTP Server Denial of Service — Trivial

Solution Details

Please refer to the External References section for links to supplemental vulnerability information and remediation details.

False Positive Notes

This item is a heuristic check and may be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

When an HTTP/2 stream was destroyed after being handled, the Apache HTTP Server prior to version 2.4.30 could have written a NULL pointer potentially to an already freed memory. The memory pools maintained by the server make this vulnerability hard to trigger in usual configurations, the reporter and the team could not reproduce it outside debug builds, so it is classified as low risk.

CVSS Base Score: 5.9

Chargen Service Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Disable the Chargen Service on this host.
For Unix systems, edit the /etc/inetd.conf file to comment out the chargen service to prevent this service from running in the future. After making the necessary configurations, please restart inetd.

For Windows systems, the chargen service may be disabled by removing the 'Simple TCP/IP' services from the network configuration.

For Cisco devices, access the enable console. Once in configuration mode, input 'no service tcp-small-servers' and 'no service udp-small-servers' to disable the chargen service.

For other systems, please consult the vendor or the system documentation.

Vulnerability Details

This host is running the character generator service, which is typically only used for testing purposes. Attackers can leverage this service to create a DoS condition on this host.

Compliance: Configure 'Access this computer from the network' — Trivial

Solution Details

To establish the recommended configuration via GP, configure the following UI path:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Access this computer from the network>

Impact: If you remove the Access this computer from the network user right on domain controllers for all users, no one will be able to log on to the domain or use network resources. If you remove this user right on member servers, users will not be able to connect to those servers through the network. Successful negotiation of IPsec connections requires that the initiating machine has this right, therefore it is recommended that it is assigned to the Users group. If you have installed optional components such as ASP.NET or Internet Information Services (IIS), you may need to assign this user right to additional accounts that are required by those components. It is important to verify that authorized users are assigned this user right for the computers they need to access the network.

Vulnerability Details

This policy setting allows other users on the network to connect to the computer and is required by various network protocols that include Server Message Block (SMB)based protocols, NetBIOS, Common Internet File System (CIFS), and Component Object Model Plus (COM+). Level 1 - Domain Controller. The recommended state for this setting is: Administrators, Authenticated Users, ENTERPRISE DOMAIN CONTROLLERS. Level 1 - Member Server. The recommended state for this setting is: Administrators, Authenticated Users.

Rationale: Users who can connect from their computer to the network can access resources on target computers for which they have permission. For example, the Access this computer from the network user right is required for users to connect to shared printers and folders. If this user right is assigned to the Everyone group, then anyone in the group will be able to read the files in those shared folders. However, this situation is unlikely for new installations of Windows Server 2003 with Service Pack 1 (SP1), because the default share and NTFS permissions in Windows Server 2003 do not include the Everyone group. This vulnerability may have a higher level of risk for computers that you upgrade from Windows NT 4.0 or Windows 2000, because the default permissions for these operating systems are not as restrictive as the default permissions in Windows Server 2003.

CCE Reference Number: CCE-35818-4
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Configure 'Accounts: Rename administrator account' | Trivial

Vulnerability Details

The built-in local administrator account is a well-known account name that attackers will target. It is recommended to choose another name for this account, and to avoid names that denote administrative or elevated access accounts. Be sure to also change the default description for the local administrator (through the Computer Management console).

Rationale: The Administrator account exists on all computers that run the Windows 2000 or later operating systems. If you rename this account, it is slightly more difficult for unauthorized persons to guess this privileged user name and password combination. The built-in Administrator account cannot be locked out, regardless of how many times an attacker might use a bad password. This capability makes the Administrator account a popular target for brute force attacks that attempt to guess passwords. The value of this countermeasure is lessened because this account has a well-known SID, and there are third-party tools that allow authentication by using the SID rather than the account name. Therefore, even if you rename the Administrator account, an attacker could launch a brute force attack by using the SID to log on.

CCE Reference Number: CCE-38233-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.1.5

Solution Details

To establish the recommended configuration via GP, configure the following UI path: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Accounts: Rename administrator account Impact: You will have to inform users who are authorized to use this account of the new account name. (The guidance for this setting assumes that the Administrator account was not disabled, which was recommended earlier in this chapter.)

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Configure 'Allow log on locally' Trivial

Vulnerability Details

This policy setting determines which users can interactively log on to computers in your environment. Logons that are initiated by pressing the CTRL+ALT+DEL key sequence on the client computer keyboard require this user right. Users who attempt to log on through Terminal Services or IIS also require this user right. The Guest account is assigned this user right by default. Although this account is disabled by default, it is recommended that you enable this setting through Group Policy. However, this user right should generally be restricted to the Administrators and Users groups. Assign this user right to the Backup Operators group if your organization requires that they have this capability. Level 1 - Domain Controller. The recommended state for this setting is: Administrators, ENTERPRISE DOMAIN CONTROLLERS. Level 1 - Member Server. The recommended state for this setting is: Administrators.

Rationale: Any account with the Allow log on locally user right can log on at the console of the computer. If you do not restrict this user right to legitimate users who need to be able to log on to the console of the computer, unauthorized users could download and run malicious software to elevate their privileges.

CCE Reference Number: CCE-37659-0
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.6

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, configure the following UI path:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Allow log on locally>

Impact: If you remove these default groups, you could limit the abilities of users who are assigned to specific administrative roles in your environment. You should confirm that delegated activities will not be adversely affected by any changes that you make to the Allow log on locally user rights assignments.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Configure 'Allow log on through Remote Desktop Services' Trivial

Vulnerability Details

This policy setting determines which users or groups have the right to log on as a Terminal Services client. Remote desktop users require this user right. If your organization uses Remote Assistance as part of its help desk strategy, create a group and assign it this user right through Group Policy. If the help desk in your organization does not use Remote Assistance, assign this user right only to the Administrators group or use the restricted groups feature to ensure that no user accounts are part of the Remote Desktop Users group. Restrict this user right to the Administrators group, and possibly the Remote Desktop Users group, to prevent unwanted users from gaining access to computers on your network by means of the Remote Assistance feature. Level 1 - Domain Controller. The recommended state for this setting is: Administrators. Level 1 - Member Server. The recommended state for this setting is: Administrators, Remote Desktop Users.

Note: A Member Server that holds the Remote Desktop Services Role with Remote Desktop Connection Broker Role Service will require a special exception to this recommendation, to allow the Authenticated Users group to be granted this user right. Note #2: The above lists are to be treated as whitelists, which implies that the above principals need not be present for assessment of this recommendation to pass.

Rationale: Any account with the Allow log on through Terminal Services user right can log on to the remote console of the computer. If you do not restrict this user right to legitimate users who need to log on to the console of the computer, unauthorized users could download and run malicious software to elevate their privileges.

CCE Reference Number: CCE-37072-6
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.7

Solution Details

To establish the recommended configuration via GP, configure the following UI path:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Allow log on through Remote Desktop Services>

Impact: Removal of the Allow log on through Terminal Services user right from other groups or membership changes in these default groups could limit the abilities of users who perform specific administrative roles in your environment. You should confirm that delegated activities will not be adversely affected.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Configure 'Create symbolic links' Trivial

Solution Details

To implement the recommended configuration state, configure the following UI path: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Create symbolic links Impact: In most cases there will be no impact because this is the default configuration, however, on Windows Servers with the Hyper-V server role installed this user right should also be granted to the special group "Virtual Machines" otherwise you will not be able to create new virtual machines.

Vulnerability Details

This policy setting determines which users can create symbolic links. In Windows Vista, existing NTFS file system objects, such as files and folders, can be accessed by referring to a new kind of file system object called a symbolic link. A symbolic link is a pointer (much like a shortcut or .lnk file) to another file system object, which can be a file, folder, shortcut or another symbolic link. The difference between a shortcut and a symbolic link is that a shortcut only works from within the Windows shell. To other programs and applications, shortcuts are just another file, whereas with symbolic links, the concept of a shortcut is implemented as a feature of the NTFS file system. Symbolic links can potentially expose security vulnerabilities in applications that are not designed to use them. For this reason, the privilege for creating symbolic links should only be assigned to trusted users. By default, only Administrators can create symbolic links. Level 1 - Domain Controller. The recommended state for this setting is: Administrators. Level 1 - Member Server. The recommended state for this setting is: Administrators and (when the Hyper-V Role is installed) NT VIRTUAL MACHINE\Virtual Machines.

Rationale: Users who have the Create Symbolic Links user right could inadvertently or maliciously expose your system to symbolic link attacks. Symbolic link attacks can be used to change the permissions on a file, to corrupt data, to destroy data, or as a Denial of Service attack.

CCE Reference Number: CCE-35823-4
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.15

False Positive Notes

Compliance: Configure 'Deny access to this computer from the network' — Trivial

Vulnerability Details

This policy setting prohibits users from connecting to a computer from across the network, which would allow users to access and potentially modify data remotely. In high security environments, there should be no need for remote users to access data on a computer. Instead, file sharing should be accomplished through the use of network servers. Level 1 - Domain Controller. The recommended state for this setting is to include: Guests, Local account. Level 1 - Member Server. The recommended state for this setting is to include: Guests, Local account and member of Administrators group.

Caution: Configuring a standalone (non-domain-joined) server as described above may result in an inability to remotely administer the server.

Note: Configuring a member server or standalone server as described above may adversely affect applications that create a local service account and place it in the Administrators group - in which case you must either convert the application to use a domain-hosted service account, or remove Local account and member of Administrators group from this User Right Assignment. Using a domain-hosted service account is strongly preferred over making an exception to this rule, where possible.

Rationale: Users who can log on to the computer over the network can enumerate lists of account names, group names, and shared resources. Users with permission to access shared folders and files can connect over the network and possibly view or modify data.

CCE Reference Number: CCE-37954-5
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.17

Solution Details

To establish the recommended configuration via GP, configure the following UI path:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Deny access to this computer from the network>

Impact: If you configure the Deny access to this computer from the network user right for other groups, you could limit the abilities of users who are assigned to specific administrative roles in your environment. You should verify that delegated tasks will not be negatively affected.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Configure 'Enable computer and user accounts to be trusted for delegation' — Trivial

Vulnerability Details

This policy setting allows users to change the Trusted for Delegation setting on a computer object in Active Directory. Abuse of this privilege could allow unauthorized users to impersonate other users on the network. Level 1 - Domain Controller. The recommended state for this setting is: Administrators. Level 1 - Member Server. The recommended state for this setting is: No One.

Rationale: Misuse of the Enable computer and user accounts to be trusted for delegation user right could allow unauthorized users to impersonate other users on the network. An attacker could exploit this privilege to gain access to network resources and make it difficult to determine what has happened after a security incident.

CCE Reference Number: CCE-36860-5
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.22

Solution Details

To establish the recommended configuration via GP, configure the following UI path:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Enable computer and user accounts to be trusted for delegation>

Impact: None - this is the default configuration.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Configure 'Impersonate a client after authentication' Trivial

Solution Details

To establish the recommended configuration via GP, configure the following UI path:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Impersonate a client after authentication>

Impact: In most cases this configuration will have no impact. If you have installed the Web Server (IIS) Role with Web Services Role Service, you will need to also assign the user right to IIS_IUSRS.

Vulnerability Details

The policy setting allows programs that run on behalf of a user to impersonate that user (or another specified account) so that they can act on behalf of the user. If this user right is required for this kind of impersonation, an unauthorized user will not be able to convince a client to connect for example, by remote procedure call (RPC) or named pipes to a service that they have created to impersonate that client, which could elevate the unauthorized user's permissions to administrative or system levels. Services that are started by the Service Control Manager have the built-in Service group added by default to their access tokens. COM servers that are started by the COM infrastructure and configured to run under a specific account also have the Service group added to their access tokens. As a result, these processes are assigned this user right when they are started. Also, a user can impersonate an access token if any of the following conditions exist: - The access token that is being impersonated is for this user. - The user, in this logon session, logged on to the network with explicit credentials to create the access token. - The requested level is less than Impersonate, such as Anonymous or Identify. An attacker with the Impersonate a client after authentication user right could create a service, trick a client to make them connect to the service, and then impersonate that client to elevate the attacker's level of access to that of the client. Level 1 - Domain Controller. The recommended state for this setting is: Administrators, LOCAL SERVICE, NETWORK SERVICE, SERVICE. Level 1 - Member Server. The recommended state for this setting is: Administrators, LOCAL SERVICE, NETWORK SERVICE, SERVICE and (when the Web Server (IIS) Role with Web Services Role Service is installed) IIS_IUSRS. Note: A Member Server with Microsoft SQL Server and its optional "Integration Services" component installed will require a special exception to this recommendation for additional SQL-generated entries to be granted this user right.

Rationale: An attacker with the Impersonate a client after authentication user right could create a service, trick a client to make them connect to the service, and then impersonate that client to elevate the attacker's level of access to that of the client.

Compliance: Configure 'Interactive logon: Message text for users attempting to log on' — Trivial

Solution Details

To establish the recommended configuration via GP, configure the following UI path to a value that is consistent with the security and operational requirements of your organization: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Interactive logon: Message text for users attempting to log on Impact: Users will see a message in a dialog box before they can log on to the server console.

Note: Windows Vista and Windows XP Professional support logon banners that can exceed 512 characters in length and that can also contain carriage-return line-feed sequences. However, Windows 2000-based clients cannot interpret and display these messages. You must use a Windows 2000-based computer to create a logon message policy that applies to Windows 2000-based computers. If you inadvertently create a logon message policy on a Windows Vista-based or Windows XP Professional-based computer and you discover that it does not display properly on Windows 2000-based computers, do the following: Change the setting to Not Defined, and then change the setting to the desired value by using a Windows 2000-based computer.

Important: If you do not reconfigure this setting to Not Defined before reconfiguring the setting using a Windows 2000-based computer, the changes will not take effect properly.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting specifies a text message that displays to users when they log on. Configure this setting in a manner that is consistent with the security and operational requirements of your organization.

Rationale: Displaying a warning message before logon may help prevent an attack by warning the attacker about the consequences of their misconduct before it happens. It may also help to reinforce corporate policy by notifying employees of the appropriate policy during the logon process. This text is often used for legal reasons#x2014;for example, to warn users about the ramifications of misusing company information or to warn them that their actions may be audited.

Note: Any warning that you display should first be approved by your organization's legal and human resources representatives.

CCE Reference Number: CCE-37226-8

Compliance: Configure 'Manage auditing and security log' — Trivial

Vulnerability Details

This policy setting determines which users can change the auditing options for files and directories and clear the Security log. For environments running Microsoft Exchange Server, the Exchange Servers group must possess this privilege on Domain Controllers to properly function. Given this, DCs granting the Exchange Servers group this privilege do conform with this benchmark. If the environment does not use Microsoft Exchange Server, then this privilege should be limited to only Administrators on DCs. Level 1 - Domain Controller. The recommended state for this setting is: Administrators and (when Exchange is running in the environment) Exchange Servers. Level 1 - Member Server. The recommended state for this setting is: Administrators.

Rationale: The ability to manage the Security event log is a powerful user right and it should be closely guarded. Anyone with this user right can clear the Security log to erase important evidence of unauthorized activity.

CCE Reference Number: CCE-35906-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.30

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, configure the following UI path: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Manage auditing and security log Impact: None. This is the default configuration.

Compliance: Configure 'Network access: Named Pipes that can be accessed anonymously' Trivial

Solution Details

To establish the recommended configuration via GP, configure the following UI path:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Named Pipes that can be accessed anonymously>

Impact: Null session access over null session access over named pipes will be disabled unless they are included, and applications that rely on this feature or on unauthenticated access to named pipes will no longer function. The BROWSER named pipe may need to be added to this list if the Computer Browser service is needed for supporting legacy components. The Computer Browser service is disabled by default.

Vulnerability Details

This policy setting determines which communication sessions, or pipes, will have attributes and permissions that allow anonymous access. The recommended state for this setting is: Level 1 - Domain Controller. The recommended state for this setting is: LSARPC, NETLOGON, SAMR and (when the legacy Computer Browser service is enabled) BROWSER. Level 1 - Member Server. The recommended state for this setting is: <blank> (i.e. None), or (when the legacy Computer Browser service is enabled) BROWSER.

Note: A Member Server that holds the Remote Desktop Services Role with Remote Desktop Licensing Role Service will require a special exception to this recommendation, to allow the HydraLSPipe and TermServLicensing Named Pipes to be accessed anonymously.

Rationale: Limiting named pipes that can be accessed anonymously will reduce the attack surface of the system.

CCE Reference Number: CCE-38258-0
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.10.6

False Positive Notes

Compliance: Configure 'Network access: Remotely accessible registry paths' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to: System\CurrentControlSet\Control\ProductOptions System\CurrentControlSet\Control\Server Applications Software\Microsoft\Windows NT\CurrentVersion

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Remotely accessible registry paths>

Impact: None - this is the default configuration. However, if you remove the default registry paths from the list of accessible ones, remote management tools such as the Microsoft Baseline Security Analyzer and Microsoft Systems Management Server could fail, as they require remote access to the registry to properly monitor and manage computers.

Note: If you want to allow remote access, you must also enable the Remote Registry service.

Vulnerability Details

This policy setting determines which registry paths will be accessible over the network, regardless of the users or groups listed in the access control list (ACL) of the winreg registry key. Note: This setting does not exist in Windows XP. There was a setting with that name in Windows XP, but it is called "Network access: Remotely accessible registry paths and sub-paths" in Windows Server 2003, Windows Vista, and Windows Server 2008. Note #2: When you configure this setting you specify a list of one or more objects. The delimiter used when entering the list is a line feed or carriage return, that is, type the first object on the list, press the Enter button, type the next object, press Enter again, etc. The setting value is stored as a comma-delimited list in group policy security templates. It is also rendered as a comma-delimited list in Group Policy Editor's display pane and the Resultant Set of Policy console. It is recorded in the registry as a line-feed delimited list in a REG_MULTI_SZ value. The recommended state for this setting is: System\CurrentControlSet\Control\ProductOptions System\CurrentControlSet\Control\Server Applications Software\Microsoft\Windows NT\CurrentVersion

Rationale: The registry is a database that contains computer configuration information, and much of the information is sensitive. An attacker could use this information to facilitate unauthorized activities. To reduce the risk of such an attack, suitable ACLs are assigned throughout the registry to help protect it from access by unauthorized users.

CCE Reference Number: CCE-37194-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.10.7

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

Compliance: Configure 'Network access: Remotely accessible registry paths and sub-paths'

Trivial

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to: System\CurrentControlSet\Control\Print\Printers System\CurrentControlSet\Services\Eventlog Software\Microsoft\OLAP Server Software\Microsoft\Windows NT\CurrentVersion\Print Software\Microsoft\Windows NT\CurrentVersion\Windows System\CurrentControlSet\Control\ContentIndex System\CurrentControlSet\Control\Terminal Server System\CurrentControlSet\Control\Terminal Server\UserConfig System\CurrentControlSet\Control\Terminal Server\DefaultUserConfiguration Software\Microsoft\Windows NT\CurrentVersion\Perflib System\CurrentControlSet\Services\SysmonLog

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Remotely accessible registry paths and sub-paths When a server holds the Active Directory Certificate Services Role with Certification Authority Role Service, the above list should also include: System\CurrentControlSet\Services\CertSvc. When a server has the WINS Server Feature installed, the above list should also include: System\CurrentControlSet\Services\WINS>

Impact: None - this is the default configuration. However, if you remove the default registry paths from the list of accessible ones, remote management tools such as the Microsoft Baseline Security Analyzer and Microsoft Systems Management Server could fail, as they require remote access to the registry to properly monitor and manage computers.

Note: If you want to allow remote access, you must also enable the Remote Registry service.

Vulnerability Details

This policy setting determines which registry paths and sub-paths will be accessible over the network, regardless of the users or groups listed in the access control list (ACL) of the winreg registry key.

Note: In Windows XP this setting is called "Network access: Remotely accessible registry paths," the setting with that same name in Windows Vista, Windows Server 2008, and Windows Server 2003 does not exist in Windows XP.

Note #2: When you configure this setting you specify a list of one or more objects. The delimiter used when entering the list is a line feed or carriage return, that is, type the first object on the list, press the Enter button, type the next object, press Enter again, etc. The setting value is stored as a comma-delimited list in group policy security templates. It is also rendered as a comma-delimited list in Group Policy Editor's display pane and the Resultant Set of Policy console. It is recorded in the registry as a line-feed delimited list in a REG_MULTI_SZ value.

The recommended state for this setting is: System\CurrentControlSet\Control\Print\Printers System\CurrentControlSet\Services\Eventlog Software\Microsoft\OLAP Server Software\Microsoft\Windows NT\CurrentVersion\Print Software\Microsoft\Windows NT\CurrentVersion\Windows System\CurrentControlSet\Control\ContentIndex System\CurrentControlSet\Control\Terminal Server System\CurrentControlSet\Control\Terminal

Server\UserConfig System\CurrentControlSet\Control\Terminal Server\DefaultUserConfiguration
Software\Microsoft\Windows NT\CurrentVersion\Perflib
System\CurrentControlSet\Services\SysmonLog

The recommended state for servers that hold the Active Directory Certificate Services Role with Certification Authority Role Service includes the above list and:
System\CurrentControlSet\Services\CertSvc

The recommended state for servers that have the WINS Server Feature installed includes the above list and: System\CurrentControlSet\Services\WINS

Rationale: The registry contains sensitive computer configuration information that could be used by an attacker to facilitate unauthorized activities. The fact that the default ACLs assigned throughout the registry are fairly restrictive and help to protect the registry from access by unauthorized users reduces the risk of such an attack.

CCE Reference Number: CCE-36347-3
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.10.8

Compliance: Disable IPv6 (Ensure TCPIP6 Parameter 'DisabledComponents' is set to '0xff (255)') — Trivial

Solution Details

To establish the recommended configuration, set the following Registry value to 0xff (255) (DWORD):
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\TCPIP6\Parameters:DisabledComponents

Note: This change does not take effect until the computer has been restarted.

Note #2: Although Microsoft does not provide an ADMX template to configure this registry value, a custom .ADM template (Disable-IPv6-Components-KB929852.adm) is provided in the CIS Benchmark Remediation Kit to facilitate its configuration. Be aware though that simply turning off the group policy setting in the .ADM template will not "undo" the change once applied. Instead, the opposite setting must be applied to change the registry value to the opposite state.

Impact: Connectivity to other systems using IPv6 will no longer operate, and software that depends on

IPv6 will cease to function. Examples of Microsoft applications that may use IPv6 include: Remote Assistance, HomeGroup, DirectAccess, Windows Mail. This registry change is documented in Microsoft Knowledge Base article 929852: How to disable IPv6 or its components in Windows.

Note: This registry change does not take effect until the next reboot.

Vulnerability Details

Internet Protocol version 6 (IPv6) is a set of protocols that computers use to exchange information over the Internet and over home and business networks. IPv6 allows for many more IP addresses to be assigned than IPv4 did. Older networking, hosts and operating systems may not support IPv6 natively. The recommended state for this setting is: DisabledComponents - 0xff (255)

Rationale: Since the vast majority of private corporate networks have no need to utilize IPv6 (because they have access to private IPv4 addressing), disabling IPv6 components reduces a possible attack surface that is also harder to monitor the traffic on. As a result, we recommend configuring IPv6 to a Disabled state when it is not needed. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.4.19.2.1

Compliance: Ensure 'Account lockout duration' is set to '15 or more minute(s)'

Trivial

Vulnerability Details

This policy setting determines the length of time that must pass before a locked account is unlocked and a user can try to log on again. The setting does this by specifying the number of minutes a locked out account will remain unavailable. If the value for this policy setting is configured to 0, locked out accounts will remain locked out until an administrator manually unlocks them. Although it might seem like a good idea to configure the value for this policy setting to a high value, such a configuration will likely increase the number of calls that the help desk receives to unlock accounts locked by mistake. Users should be aware of the length of time a lock remains in place, so that they realize they only need to call the help desk if they have an extremely urgent need to regain access to their computer. The recommended state for this setting is: 15 or more minute(s).

Rationale: A denial of service (DoS) condition can be created if an attacker abuses the Account lockout threshold and repeatedly attempts to log on with a specific account. Once you configure the Account lockout threshold setting, the account will be locked out after the specified number of failed attempts. If you configure the Account lockout duration setting to 0, then the account will remain locked out until an administrator unlocks it manually.

CCE Reference Number: CCE-37034-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 1.2.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to 15 or more minute(s): Computer Configuration\Policies\Windows Settings\Security Settings\Account Policies\Account Lockout Policy\Account lockout duration Impact: Although it may seem like a good idea to configure this policy setting to never automatically unlock an account, such a configuration can increase the number of requests that your organization's help desk receives to unlock accounts that were locked by mistake.

CVSS Base Score: 0

Compliance: Ensure 'Account lockout threshold' is set to '10 or fewer invalid logon attempt(s), but not 0' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to 10 or fewer invalid login attempt(s), but not 0: Computer Configuration\Policies\Windows Settings\Security Settings\Account Policies\Account Lockout Policy\Account lockout threshold Impact: If this policy setting is enabled, a locked-out account will not be usable until it is reset by an administrator or until the account lockout duration expires. This setting may generate additional help desk calls. If you enforce this setting an attacker could cause a denial of service condition by deliberately generating failed logons for multiple user, therefore you should also configure the Account Lockout Duration to a relatively low value. If you configure the Account Lockout Threshold to 0, there is a possibility that an attacker's attempt to discover passwords with a brute force password attack might go undetected if a robust audit mechanism is not in place.

Vulnerability Details

This policy setting determines the number of failed logon attempts before the account is locked. Setting this policy to 0 does not conform with the benchmark as doing so disables the account lockout threshold. The recommended state for this setting is: 10 or fewer invalid logon attempt(s), but not 0.

Rationale: Setting an account lockout threshold reduces the likelihood that an online password brute force attack will be successful. Setting the account lockout threshold too low introduces risk of increased accidental lockouts and/or a malicious actor intentionally locking out accounts.

CCE Reference Number: CCE-36008-1

Compliance: Ensure 'Accounts: Administrator account status' is set to 'Disabled' — Trivial

Vulnerability Details

This policy setting enables or disables the Administrator account during normal operation. When a computer is booted into safe mode, the Administrator account is always enabled, regardless of how this setting is configured. Note that this setting will have no impact when applied to the domain controller organizational unit via group policy because domain controllers have no local account database. It can be configured at the domain level via group policy, similar to account lockout and password policy settings. The recommended state for this setting is: Disabled.

Rationale: In some organizations, it can be a daunting management challenge to maintain a regular schedule for periodic password changes for local accounts. Therefore, you may want to disable the built-in Administrator account instead of relying on regular password changes to protect it from attack. Another reason to disable this built-in account is that it cannot be locked out no matter how many failed logons it accrues, which makes it a prime target for brute force attacks that attempt to guess passwords. Also, this account has a well-known security identifier (SID) and there are third-party tools that allow authentication by using the SID rather than the account name. This capability means that even if you rename the Administrator account, an attacker could launch a brute force attack by using the SID to log on.

CCE Reference Number: CCE-37953-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.1.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Accounts: Administrator account status Impact: Maintenance issues can arise under certain circumstances if you disable the Administrator account. For example, if the secure channel between a member computer and the domain controller fails in a domain environment for any reason and there is no other local Administrator account, you must restart in safe mode to fix the problem that broke the secure channel. If the current Administrator password does not meet the password requirements, you will not be able to re-enable the Administrator account after it is disabled. If this situation occurs, another member of the Administrators group must set the password on the Administrator account with the Local Users and Groups tool.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Accounts: Block Microsoft accounts' is set to 'Users can't add or log on with Microsoft accounts'	Trivial

Vulnerability Details

This policy setting prevents users from adding new Microsoft accounts on this computer. If you select the "Users can't add Microsoft accounts" option, users will not be able to create new Microsoft accounts on this computer, switch a local account to a Microsoft account, or connect a domain account to a Microsoft account. This is the preferred option if you need to limit the use of Microsoft accounts in your enterprise. If you select the "Users can't add or log on with Microsoft accounts" option, existing Microsoft account users will not be able to log on to Windows. Selecting this option might make it impossible for an existing administrator on this computer to log on and manage the system. If you disable or do not configure this policy (recommended), users will be able to use Microsoft accounts with Windows. The recommended state for this setting is: Users can't add or log on with Microsoft accounts.

Rationale: Organizations that want to effectively implement identity management policies and maintain firm control of what accounts are used to log onto their computers will probably want to block Microsoft accounts. Organizations may also need to block Microsoft accounts in order to meet the requirements of compliance standards that apply to their information systems.

CCE Reference Number: CCE-36147-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.1.2

Solution Details

To establish the recommended configuration via GP, set the following UI path to Users can't add or log on with Microsoft accounts: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Accounts: Block Microsoft accounts Impact: Users will not be able to log onto the computer with their Microsoft account.

False Positive Notes

Compliance: Ensure 'Accounts: Guest account status' is set to 'Disabled'	Trivial

Vulnerability Details

This policy setting determines whether the Guest account is enabled or disabled. The Guest account allows unauthenticated network users to gain access to the system. Note that this setting will have no impact when applied to the domain controller organizational unit via group policy because domain controllers have no local account database. It can be configured at the domain level via group policy, similar to account lockout and password policy settings. The recommended state for this setting is: Disabled.

Rationale: The default Guest account allows unauthenticated network users to log on as Guest with no password. These unauthorized users could access any resources that are accessible to the Guest account over the network. This capability means that any network shares with permissions that allow access to the Guest account, the Guests group, or the Everyone group will be accessible over the network, which could lead to the exposure or corruption of data.

CCE Reference Number: CCE-37432-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.1.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Accounts: Guest account status Impact: All network users will need to authenticate before they can access shared resources. If you disable the Guest account and the Network Access: Sharing and Security Model option is set to Guest Only, network logons, such as those performed by the Microsoft Network Server (SMB Service), will fail. This policy setting should have little impact on most organizations because it is the default setting in Microsoft Windows 2000, Windows XP, and Windows Server#x2122; 2003.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Accounts: Limit local account use of blank passwords to console logon only' is set to 'Enabled'

Trivial

Vulnerability Details

This policy setting determines whether local accounts that are not password protected can be used to log on from locations other than the physical computer console. If you enable this policy setting, local accounts that have blank passwords will not be able to log on to the network from remote client computers. Such accounts will only be able to log on at the keyboard of the computer. The recommended state for this setting is: Enabled.

Rationale: Blank passwords are a serious threat to computer security and should be forbidden through both organizational policy and suitable technical measures. In fact, the default settings for Active Directory domains require complex passwords of at least seven characters. However, if users with the ability to create new accounts bypass your domain-based password policies, they could create accounts with blank passwords.

For example, a user could build a stand-alone computer, create one or more accounts with blank passwords, and then join the computer to the domain. The local accounts with blank passwords would still function. Anyone who knows the name of one of these unprotected accounts could then use it to log on.

CCE Reference Number: CCE-37615-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.1.4

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Accounts: Limit local account use of blank passwords to console logon only Impact: None. This is the default configuration.

CVSS Base Score: 0

Compliance: Ensure 'Add workstations to domain' is set to 'Administrators' (DC only)	Trivial

Vulnerability Details

This policy setting specifies which users can add computer workstations to a specific domain. For this policy setting to take effect, it must be assigned to the user as part of the Default Domain Controller Policy for the domain. A user who has been assigned this right can add up to 10 workstations to the domain. Users who have been assigned the Create Computer Objects permission for an OU or the Computers container in Active Directory can add an unlimited number of computers to the domain, regardless of whether they have been assigned the Add workstations to a domain user right. By default, all users in the Authenticated Users group have the ability to add up to 10 computer accounts to an Active Directory domain. These new computer accounts are created in the Computers container. In Windows-based networks, the term security principal is defined as a user, group, or computer that is automatically assigned a security identifier to control access to resources. In an Active Directory domain, each computer account is a full security principal with the ability to authenticate and access domain resources. However, some organizations may want to limit the number of computers in an Active Directory environment so that they can consistently track, build, and manage the computers. If users are allowed to add computers to the domain, tracking and management efforts would be hampered. Also, users could perform activities that are more difficult to trace because of their ability to create additional unauthorized domain computers. The recommended state for this setting is: Administrators.

Rationale: The Add workstations to domain user right presents a moderate vulnerability. Users with this right could add a computer to the domain that is configured in a way that violates organizational security policies. For example, if your organization does not want its users to have administrative privileges on their computers, a user could install Windows on his or her computer and then add the computer to the domain. The user would know the password for the local administrator account, and could log on with that account and then add his or her domain account to the local Administrators group.

CCE Reference Number: CCE-36282-2
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.4

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Add workstations to domain>

Impact: For organizations that have never allowed users to set up their own computers and add them to the domain, this countermeasure will have no impact. For those that have allowed some or all users to configure their own computers, this countermeasure will force the organization to establish a formal process for these procedures going forward. It will not affect existing computers unless they are removed from and re-added to the domain.

CVSS Base Score: 0

Compliance: Ensure 'Adjust memory quotas for a process' is set to 'Administrators, LOCAL SERVICE, NETWORK SERVICE'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators, LOCAL SERVICE, NETWORK SERVICE: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Adjust memory quotas for a process Impact: Organizations that have not restricted users to roles with limited privileges will find it difficult to impose this countermeasure. Also, if you have installed optional components such as ASP.NET or IIS, you may need to assign the Adjust memory quotas for a process user right to additional accounts that are required by those components. Otherwise, this countermeasure should have no impact on most computers. If this user right is necessary for a user account, it can be assigned to a local computer account instead of a domain account.

Vulnerability Details

This policy setting allows a user to adjust the maximum amount of memory that is available to a process. The ability to adjust memory quotas is useful for system tuning, but it can be abused. In the wrong hands, it could be used to launch a denial of service (DoS) attack. The recommended state for this setting is: Administrators, LOCAL SERVICE, NETWORK SERVICE.

Note: A server that holds the Web Server (IIS) Role with Web Server Role Service will require a special exception to this recommendation, to allow IIS application pool(s) to be granted this user right.

Rationale: A user with the Adjust memory quotas for a process privilege can reduce the amount of memory that is available to any process, which could cause business-critical network applications to become slow or to fail. In the wrong hands, this privilege could be used to start a denial of service (DoS) attack.

CCE Reference Number: CCE-37071-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.5

False Positive Notes

Compliance: Ensure 'Allow Basic authentication' is set to 'Disabled' — Trivial

Vulnerability Details

This policy setting allows you to manage whether the Windows Remote Management (WinRM) service accepts Basic authentication from a remote client. If you enable this policy setting, the WinRM service will accept Basic authentication from a remote client. If you disable or do not configure this policy setting, the WinRM service will not accept Basic authentication from a remote client. The recommended state for this setting is: Disabled.

Rationale: Basic authentication is less robust than other authentication methods available in WinRM because credentials including passwords are transmitted in plain text. An attacker who is able to capture packets on the network where WinRM is running may be able to determine the credentials used for accessing remote hosts via WinRM.

CCE Reference Number: CCE-36254-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.81.2.1

Compliance: Ensure 'Allow Cortana above lock screen' is set to 'Disabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Search\Allow Cortana above lock screen

Note: This Group Policy path does not exist by default. An updated Group Policy template (Search.admx/adml) is required - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer).

Impact: The system will need to be unlocked for the user to interact with Cortana using speech.

Vulnerability Details

This policy setting determines whether or not the user can interact with Cortana using speech while the system is locked. The recommended state for this setting is: Disabled.

Rationale: Access to any computer resource should not be allowed when the device is locked. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.54.3

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Ensure 'Allow Cortana' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Search\Allow Cortana

Note: This Group Policy path does not exist by default. An updated Group Policy template (Search.admx/adml) is required - it is included with the Microsoft Windows 10 Administrative Templates. Impact: Cortana will be turned off. Users will still be able to use search to find things on the device and on the Internet.

Vulnerability Details

This policy setting specifies whether Cortana is allowed on the device. The recommended state for this setting is: Disabled.

Rationale: If Cortana is enabled, sensitive information could be contained in search history and sent out to Microsoft. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.54.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Ensure 'Allow Extensions' is set to 'Disabled'	Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Microsoft Edge\Allow Extensions>

Impact: Employees will not be able to use Edge Extensions.

Vulnerability Details

This setting lets you decide whether employees can load extensions in Microsoft Edge. The recommended state for this setting is: Disabled.

Rationale: To prevent malicious extensions from being loaded, only approved extensions should be installed. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.41.1

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

Compliance: Ensure 'Allow indexing of encrypted files' is set to 'Disabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Search\Allow indexing of encrypted files Note: This Group Policy path does not exist by default. An additional Group Policy template (Search.admx/adml) is required - it is included with the Microsoft Windows Vista, 2008, 7/2008R2, 8/2012, 8.1/2012R2 and Windows 10 Administrative Templates.

Impact: The search service components (including non-Microsoft components) will not encrypted items or encrypted stores.

Vulnerability Details

This policy setting allows encrypted items to be indexed. If you enable this policy setting, indexing will attempt to decrypt and index the content (access restrictions will still apply). If you disable this policy setting, the search service components (including non-Microsoft components) are expected not to index encrypted items or encrypted stores. This policy setting is not configured by default. If you do not configure this policy setting, the local setting, configured through Control Panel, will be used. By default, the Control Panel setting is set to not index encrypted content. When this setting is enabled or disabled, the index is rebuilt completely. Full volume encryption (such as BitLocker Drive Encryption or a non-Microsoft solution) must be used for the location of the index to maintain security for encrypted files. The recommended state for this setting is: Disabled.

Rationale: Indexing and allowing users to search encrypted files could potentially reveal confidential data stored within the encrypted files.

CCE Reference Number: CCE-38277-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.50.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Allow indexing of encrypted files' is set to 'Disabled'

Trivial

Vulnerability Details

This policy setting controls whether encrypted items are allowed to be indexed. When this setting is changed, the index is rebuilt completely. Full volume encryption (such as BitLocker Drive Encryption or a non-Microsoft solution) must be used for the location of the index to maintain security for encrypted files. The recommended state for this setting is: Disabled.

Rationale: Indexing and allowing users to search encrypted files could potentially reveal confidential data stored within the encrypted files.

CCE Reference Number: CCE-38277-0
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.54.4

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Search\Allow indexing of encrypted files

Note: This Group Policy path does not exist by default. An additional Group Policy template (Search.admx/adml) is required - it is included with the Microsoft Windows Vista, 2008, 7/2008R2, 8/2012, 8.1/2012R2 and Windows 10 Administrative Templates.

Impact: None - this is the default configuration.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Allow InPrivate Browsing' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Microsoft Edge\Allow InPrivate Browsing>

Impact: Employees will not be able to use InPrivate website browsing.

Vulnerability Details

This setting lets you decide whether employees can browse using InPrivate website browsing. The recommended state for this setting is: Disabled.

Rationale: Even though web filter logs can monitor traffic to and from websites, it is always a good practice to try and keep multiple source of logs. It can also be helpful to keep user from privately browsing in order to troubleshoot malicious site visits if a machine has become compromised.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.41.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Ensure 'Allow Input Personalization' is set to 'Disabled' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Control Panel\Regional and Language Options\Allow Input Personalization>

Impact: Automatic learning of speech, inking, and typing stops and users cannot change its value via PC Settings.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy enables the automatic learning component of input personalization that includes speech, inking, and typing. Automatic learning enables the collection of speech and handwriting patterns, typing history, contacts, and recent calendar information. It is required for the use of Cortana. Some of this collected information may be stored on the user's OneDrive, in the case of inking and typing; some of the information will be uploaded to Microsoft to personalize speech. The recommended state for this setting is: Disabled.

Rationale: If this setting is Enabled sensitive information could be stored in the cloud or sent to Microsoft. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.1.2.1

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

Compliance: Ensure 'Allow Microsoft accounts to be optional' is set to 'Enabled' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\App runtime\Allow Microsoft accounts to be optional Impact: Windows Store apps that typically require a Microsoft account to sign in will allow users to sign in with an enterprise account instead.

Vulnerability Details

This policy setting lets you control whether Microsoft accounts are optional for Windows Store apps that require an account to sign in. This policy only affects Windows Store apps that support it. If you enable this policy setting, Windows Store apps that typically require a Microsoft account to sign in will allow users to sign in with an enterprise account instead. If you disable or do not configure this policy setting, users will need to sign in with a Microsoft account. The recommended state for this setting is: Enabled.

Rationale: Enabling this setting allows an organization to use their enterprise user accounts instead of using their Microsoft accounts when accessing Windows store apps. This provides the organization with greater control over relevant credentials. Microsoft accounts cannot be centrally managed and as such enterprise credential security policies cannot be applied to them, which could put any information accessed by using Microsoft accounts at risk.

CCE Reference Number: CCE-38354-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.6.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Ensure 'Allow network connectivity during connected-standby (on battery)' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\System\Power Management\Sleep Settings\Allow network connectivity during connected-standby (on battery)

Note: This Group Policy path does not exist by default. An updated Group Policy template (Power.admx/adml) is required - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer).

Impact: Network connectivity in standby (while on battery) is not guaranteed. This connectivity restriction currently only applies to WLAN networks only, but is subject to change (according to Microsoft).

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting allows you to control the network connectivity state in standby on modern standby-capable systems. The recommended state for this setting is: Disabled.

Rationale: Disabling this setting ensures that the computer will not be accessible to attackers over a WLAN network while left unattended, on battery and in a sleep state.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.29.5.1

CVSS Base Score: 0

Compliance: Ensure 'Allow remote server management through WinRM' is set to 'Disabled' — Trivial

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to Disabled:

<Computer Configuration\Administrative Templates\Windows Components\Windows Remote Management (WinRM)\WinRM Service\Allow remote server management through WinRM>

Impact: None - this is the default behavior.

Vulnerability Details

This policy setting allows you to manage whether the Windows Remote Management (WinRM) service automatically listens on the network for requests on the HTTP transport over the default HTTP port. The recommended state for this setting is: Disabled.

Rationale: Any feature is a potential avenue of attack, those that enable inbound network connections are particularly risky. Only enable the use of the Windows Remote Management (WinRM) service on trusted networks and when feasible employ additional controls such as IPsec.

CCE Reference Number: CCE-37927-1
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.86.2.2

False Positive Notes

Compliance: Ensure 'Allow Remote Shell Access' is set to 'Disabled' — Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to Disabled:

<Computer Configuration\Administrative Templates\Windows Components\Windows Remote Shell\Allow Remote Shell Access>

Impact: New Remote Shell connections are not allowed and are rejected by the server.

Note: On Server 2012 (non-R2) and higher, due to design changes in the OS after Server 2008 R2, configuring this setting as prescribed will prevent the ability to add or remove Roles and Features (even locally) via the GUI. We therefore recommend that the necessary Roles and Features be installed prior to configuring this setting on a Level 2 server. Alternatively, Roles and Features can still be added or removed using the PowerShell commands Add-WindowsFeature or Remove-WindowsFeature in the Server Manager module, even with this setting configured.

Vulnerability Details

This policy setting allows you to manage configuration of remote access to all supported shells to execute scripts and commands. The recommended state for this setting is: Disabled.

Note: The GPME help text for this setting is incorrectly worded, implying that configuring it to Enabled will reject new remote shell connections, and setting it to Disabled will allow remote shell connections. The opposite is true (and is consistent with the title of the setting). This is a wording mistake by Microsoft in the Administrative Template.

Rationale: Any feature is a potential avenue of attack, those that enable inbound network connections are particularly risky. Only enable the use of the Windows Remote Shell on trusted networks and when feasible employ additional controls such as IPsec.

CCE Reference Number: CCE-36499-2

Compliance: Ensure 'Allow search and Cortana to use location' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Search\Allow search and Cortana to use location

Note: This Group Policy path does not exist by default. An updated Group Policy template (Search.admx/adml) is required - it is included with the Microsoft Windows 10 Administrative Templates.

Impact: Search and Cortana will not have access to location information.

Vulnerability Details

This policy setting specifies whether search and Cortana can provide location aware search and Cortana results. The recommended state for this setting is: Disabled.

Rationale: In an Enterprise having Cortana and Search having access to location is unnecessary. Organizations may not want this information shared out.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.54.5

False Positive Notes

Compliance: Ensure 'Allow suggested apps in Windows Ink Workspace' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Ink Workspace\Allow suggested apps in Windows Ink Workspace

Note: This Group Policy path does not exist by default. An updated Group Policy template (WindowsInkWorkspace.admx/adml) is required - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer).

Impact: The suggested apps in Windows Ink Workspace will not be allowed.

Vulnerability Details

This policy setting determines whether suggested apps in Windows Ink Workspace are allowed. The recommended state for this setting is: Disabled.

Rationale: Disabling this setting will help ensure your data is not shared with any third party. The Microsoft feature will collect data and suggested apps based on that data collected.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.73.1

False Positive Notes

Compliance: Ensure 'Allow Telemetry' is set to 'Enabled: 0 - Security [Enterprise Only]' — Trivial

Vulnerability Details

This policy setting determines the amount of diagnostic and usage data reported to Microsoft. A value of 0 will send minimal data to Microsoft. This data includes Malicious Software Removal Tool (MSRT) & Windows Defender data, if enabled, and telemetry client settings. Setting a value of 0 applies to enterprise, EDU, IoT and server devices only. Setting a value of 0 for other devices is equivalent to choosing a value of 1. A value of 1 sends only a basic amount of diagnostic and usage data.

Note that setting values of 0 or 1 will degrade certain experiences on the device. A value of 2 sends enhanced diagnostic and usage data. A value of 3 sends the same data as a value of 2, plus additional diagnostics data, including the files and content that may have caused the problem. Windows 10 telemetry settings apply to the Windows operating system and some first party apps. This setting does not apply to third party apps running on Windows 10. The recommended state for this setting is: Enabled: 0 - Security [Enterprise Only]. Note: If the "Allow Telemetry" setting is configured to "0 - Security [Enterprise Only]", then the options in Windows Update to defer upgrades and updates will have no effect.

Rationale: Sending any data to a 3rd party vendor is a security concern and should only be done on an as needed basis. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.16.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: 0 - Security [Enterprise Only]: Computer Configuration\Policies\Administrative Templates\Windows Components\Data Collection and Preview Builds\Allow Telemetry

Note: This Group Policy path does not exist by default. An additional Group Policy template (datacollection.admx/adml) is required - it is included with the Microsoft Windows 10 Administrative Templates.

Impact: Note that setting values of 0 or 1 will degrade certain experiences on the device.

Compliance: Ensure 'Allow unencrypted traffic' is set to 'Disabled' — Trivial

Vulnerability Details

This policy setting allows you to manage whether the Windows Remote Management (WinRM) service sends and receives unencrypted messages over the network. If you enable this policy setting, the WinRM client sends and receives unencrypted messages over the network. If you disable or do not configure this policy setting, the WinRM client sends or receives only encrypted messages over the network. The recommended state for this setting is: Disabled.

Rationale: Encrypting WinRM network traffic reduces the risk of an attacker viewing or modifying WinRM messages as they transit the network.

CCE Reference Number: CCE-38223-4
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.81.2.2

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Remote Management (WinRM)\WinRM Service\Allow unencrypted traffic Impact: None - this is the default behavior.

False Positive Notes

Compliance: Ensure 'Allow user control over installs' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Installer\Allow user control over installs Impact: If you disable or do not configure this policy setting, the security features of Windows Installer prevent users from changing installation options typically reserved for system administrators, such as specifying the directory to which files are installed.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Permits users to change installation options that typically are available only to system administrators. The security features of Windows Installer prevent users from changing installation options typically reserved for system administrators, such as specifying the directory to which files are installed. If Windows Installer detects that an installation package has permitted the user to change a protected option, it stops the installation and displays a message. These security features operate only when the installation program is running in a privileged security context in which it has access to directories denied to the user. The recommended state for this setting is: Disabled.

Rationale: In an Enterprise environment, only IT staff with administrative rights should be installing or changing software on a system. Allowing users the ability can risk unapproved software from being installed our removed from a system which could cause the system to become vulnerable.

Compliance: Ensure 'Allow Windows Ink Workspace' is set to 'Enabled: On, but disallow access above lock' OR 'Disabled' but not 'Enabled: On'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: On, but disallow access above lock OR Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Ink Workspace\Allow Windows Ink Workspace

Note: This Group Policy path does not exist by default. An updated Group Policy template (WindowsInkWorkspace.admx/adml) is required - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer). Impact: Windows Ink Workspace will not be permitted above the lock screen.

Vulnerability Details

This policy setting determines whether Windows Ink items are allowed above the lock screen. The recommended state for this setting is: Enabled: On, but disallow access above lock OR Disabled.

Rationale: Allowing any apps to be accessed while system is locked is not recommended. If this feature is permitted, it should only be accessible once a user authenticates with the proper credentials. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.73.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Always install with elevated privileges' is set to 'Disabled'

Trivial

Vulnerability Details

Directs Windows Installer to use system permissions when it installs any program on the system. This setting extends elevated privileges to all programs. These privileges are usually reserved for programs that have been assigned to the user (offered on the desktop), assigned to the computer (installed automatically), or made available in Add or Remove Programs in Control Panel. This setting lets users install programs that require access to directories that the user might not have permission to view or change, including directories on highly restricted computers. If you disable this setting or do not configure it, the system applies the current user's permissions when it installs programs that a system administrator does not distribute or offer.
Note: This setting appears both in the Computer Configuration and User Configuration folders. To make this setting effective, you must enable the setting in both folders.

Caution: Skilled users can take advantage of the permissions this setting grants to change their privileges and gain permanent access to restricted files and folders. Note that the User Configuration version of this setting is not guaranteed to be secure. The recommended state for this setting is: Disabled.

Rationale: Users with limited privileges can exploit this feature by creating a Windows Installer installation package that creates a new local account that belongs to the local built-in Administrators group, adds their current account to the local built-in Administrators group, installs malicious software, or performs other unauthorized activities.

CCE Reference Number: CCE-37490-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 19.7.37.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: User Configuration\Policies\Administrative Templates\Windows Components\Windows Installer\Always install with elevated privileges Impact: Windows Installer will apply the current user's permissions when it installs programs, this will prevent standard users from installing applications that affect system-wide configuration items.

Compliance: Ensure 'Always install with elevated privileges' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Installer\Always install with elevated privileges>

Impact: None - this is the default configuration.

Vulnerability Details

This setting controls whether or not Windows Installer should use system permissions when it installs any program on the system.

Note: This setting appears both in the Computer Configuration and User Configuration folders. To make this setting effective, you must enable the setting in both folders.

Caution: If enabled, skilled users can take advantage of the permissions this setting grants to change their privileges and gain permanent access to restricted files and folders. Note that the User Configuration version of this setting is not guaranteed to be secure. The recommended state for this setting is: Disabled.

Compliance: Ensure 'Always prompt for password upon connection' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Security\Always prompt for password upon connection Impact: Users will always have to enter their password when they establish new Terminal Server sessions.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting specifies whether Terminal Services always prompts the client computer for a password upon connection. You can use this policy setting to enforce a password prompt for users who log on to Terminal Services, even if they already provided the password in the Remote Desktop Connection client. By default, Terminal Services allows users to automatically log on if they enter a password in the Remote Desktop Connection client.

Note: If you do not configure this policy setting, the local computer administrator can use the Terminal Services Configuration tool to either allow or prevent passwords from being automatically sent. The recommended state for this setting is: Enabled.

Rationale: Users have the option to store both their username and password when they create a new Remote Desktop connection shortcut. If the server that runs Terminal Services allows users who have used this feature to log on to the server but not enter their password, then it is possible that an attacker who has gained physical access to the user's computer could connect to a Terminal Server through the Remote Desktop connection shortcut, even though they may not know the user's password.

CCE Reference Number: CCE-37929-7

Compliance: Ensure 'Application: Control Event Log behavior when the log file reaches its maximum size' is set to 'Disabled'

Trivial

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Event Log Service\Application\Control Event Log behavior when the log file reaches its maximum size Impact: If you enable this policy setting and a log file reaches its maximum size, new events are not written to the log and are lost. If you disable or do not configure this policy setting and a log file reaches its maximum size, new events overwrite old events.

Vulnerability Details

This policy setting controls Event Log behavior when the log file reaches its maximum size. If you enable this policy setting and a log file reaches its maximum size, new events are not written to the log and are lost. If you disable or do not configure this policy setting and a log file reaches its maximum size, new events overwrite old events. The recommended state for this setting is: Disabled.

Note: Old events may or may not be retained according to the "Backup log automatically when full" policy setting.

Rationale: If new events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users.

Compliance: Ensure 'Application: Specify the maximum log file size (KB)' is set to 'Enabled: 32,768 or greater'

Trivial

Vulnerability Details

This policy setting specifies the maximum size of the log file in kilobytes. If you enable this policy setting, you can configure the maximum log file size to be between 1 megabyte (1,024 kilobytes) and 2 terabytes (2,147,483,647 kilobytes) in kilobyte increments. If you disable or do not configure this policy setting, the maximum size of the log file will be set to the locally configured value. This value can be changed by the local administrator using the Log Properties dialog and it defaults to 20 megabytes. The recommended state for this setting is: Enabled: 32,768 or greater.

Rationale: If events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users.

CCE Reference Number: CCE-37948-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.24.1.2

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Enabled: 32,768 or greater: Computer Configuration\Policies\Administrative Templates\Windows Components\Event Log Service\Application\Specify the maximum log file size (KB) Impact: When event logs fill to capacity, they will stop recording information unless the retention method for each is set so that the computer will overwrite the oldest entries with the most recent ones. To mitigate the risk of loss of recent data, you can configure the retention method so that older events are overwritten as needed. The consequence of this configuration is that older events will be removed from the logs. Attackers can take advantage of such a configuration, because they can generate a large number of extraneous events to overwrite any evidence of their attack. These risks can be somewhat reduced if you automate the archival and backup of event log data. Ideally, all specifically monitored events should be sent to a server that uses Microsoft System Center Operations Manager (SCOM) or some other automated monitoring tool. Such a configuration is particularly important because an attacker who successfully compromises a server could clear the Security log. If all events are sent to a monitoring server, then you will be able to gather forensic information about the attacker's activities.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Apply UAC restrictions to local accounts on network logons' is set to 'Enabled' (MS only) — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\SCM: Pass the Hash Mitigations\Apply UAC restrictions to local accounts on network logons

Note: This Group Policy path does not exist by default. An additional Group Policy template (PtH.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM).
Impact: None - this is the default behavior.

Vulnerability Details

This setting controls whether local accounts can be used for remote administration via network logon (e.g., NET USE, connecting to C$, etc.). Local accounts are at high risk for credential theft when the same account and password is configured on multiple systems. Enabling this policy significantly reduces that risk. Enabled: Applies UAC token-filtering to local accounts on network logons. Membership in powerful group such as Administrators is disabled and powerful privileges are removed from the resulting access token. This configures the LocalAccountTokenFilterPolicy registry value to 0. This is the default behavior for Windows. Disabled: Allows local accounts to have full administrative rights when authenticating via network logon, by configuring the LocalAccountTokenFilterPolicy registry value to 1. For more information about local accounts and credential theft, review the "Mitigating Pass-the-Hash (PtH) Attacks and Other Credential Theft Techniques" documents. For more information about LocalAccountTokenFilterPolicy, see Microsoft Knowledge Base article 951016: Description of User Account Control and remote restrictions in Windows Vista. The recommended state for this setting is: Enabled.

Rationale: Local accounts are at high risk for credential theft when the same account and password is configured on multiple systems. Ensuring this policy is Enabled significantly reduces that risk.

CCE Reference Number: CCE-37069-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.6.1

Vulnerability Details

This subcategory reports changes in audit policy including SACL changes. Events for this subcategory include: 4715: The audit policy (SACL) on an object was changed. 4719: System audit policy was changed. 4902: The Per-user audit policy table was created. 4904: An attempt was made to register a security event source. 4905: An attempt was made to unregister a security event source. 4906: The CrashOnAuditFail value has changed. 4907: Auditing settings on object were changed. 4908: Special Groups Logon table modified. 4912: Per User Audit Policy was changed. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may be useful when investigating a security incident.

CCE Reference Number: CCE-38028-7
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 17.7.1

Compliance: Ensure 'Audit Authentication Policy Change' is set to 'Success'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success: Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\Policy Change\Audit Authentication Policy Change Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This subcategory reports changes in authentication policy. Events for this subcategory include: 4706: A new trust was created to a domain. 4707: A trust to a domain was removed. 4713: Kerberos policy was changed. 4716: Trusted domain information was modified. 4717: System security access was granted to an account. 4718: System security access was removed from an account. 4739: Domain Policy was changed. 4864: A namespace collision was detected. 4865: A trusted forest information entry was added. 4866: A trusted forest information entry was removed. 4867: A trusted forest information entry was modified. The recommended state for this setting is: Success.

Rationale: Auditing these events may be useful when investigating a security incident.

Compliance: Ensure 'Audit Credential Validation' is set to 'Success and Failure'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure: Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\Account Logon\Audit Credential Validation Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the

Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Vulnerability Details

This subcategory reports the results of validation tests on credentials submitted for a user account logon request. These events occur on the computer that is authoritative for the credentials. For domain accounts, the domain controller is authoritative, whereas for local accounts, the local computer is authoritative. In domain environments, most of the Account Logon events occur in the Security log of the domain controllers that are authoritative for the domain accounts. However, these events can occur on other computers in the organization when local accounts are used to log on. Events for this subcategory include: 4774: An account was mapped for logon. 4775: An account could not be mapped for logon. 4776: The domain controller attempted to validate the credentials for an account. 4777: The domain controller failed to validate the credentials for an account. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may be useful when investigating a security incident.

CCE Reference Number: CCE-37741-6

Compliance: Ensure 'Audit Directory Service Access' is set to 'Success and Failure' (DC only)

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure:

<Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\DS Access\Audit Directory Service Access>

Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and

computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Vulnerability Details

This subcategory reports when an AD DS object is accessed. Only objects with SACLs cause audit events to be generated, and only when they are accessed in a manner that matches their SACL. These events are similar to the directory service access events in previous versions of Windows Server. This subcategory applies only to domain controllers. Events for this subcategory include: 4662: An operation was performed on an object. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may be useful when investigating a security incident.

CCE Reference Number: CCE-37433-0

Compliance: Ensure 'Audit Directory Service Changes' is set to 'Success and Failure' (DC only) — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure.

<Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\DS Access\Audit Directory Service Changes>

Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Vulnerability Details

This subcategory reports changes to objects in Active Directory Domain Services (AD DS). The types of changes that are reported are create, modify, move, and undelete operations that are performed on an object. DS Change auditing, where appropriate, indicates the old and new values of the changed properties of the objects that were changed. Only objects with SACLs cause audit events to be generated, and only when they are accessed in a manner that matches their SACL. Some objects and properties do not cause audit events to be generated due to settings on the object class in the schema. This subcategory applies only to domain controllers. Events for this subcategory include: 5136: A directory service object was modified. 5137: A directory service object was created. 5138: A directory service object was undeleted. 5139: A directory service object was moved. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may be useful when investigating a security incident.

CCE Reference Number: CCE-37616-0

Compliance: Ensure 'Audit Distribution Group Management' is set to 'Success and Failure' (DC only)

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure:

<Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\Account Management\Audit Distribution Group Management>

Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Vulnerability Details

This subcategory reports each event of distribution group management, such as when a distribution group is created, changed, or deleted or when a member is added to or removed from a distribution group. If you enable this Audit policy setting, administrators can track events to detect malicious, accidental, and authorized creation of group accounts. Events for this subcategory include: 4744: A security-disabled local group was created. 4745: A security-disabled local group was changed. 4746: A member was added to a security-disabled local group. 4747: A member was removed from a security-disabled local group. 4748: A security-disabled local group was deleted. 4749: A security-disabled global group was created. 4750: A security-disabled global group was changed. 4751: A member was added to a security-disabled global group. 4752: A member was removed from a security-disabled global group. 4753: A security-disabled global group was deleted. 4759: A security-disabled universal group was created. 4760: A security-disabled universal group was changed. 4761: A member was added to a security-disabled universal group. 4762: A member was removed from a security-disabled universal group. 4763: A security-disabled universal group was deleted. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may provide an organization with insight when investigating an incident. For example, when a given unauthorized user was added to a sensitive distribution group.

Compliance: Ensure 'Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings Impact: The individual audit policy subcategories that are available in Windows Vista are not exposed in the interface of Group Policy tools. Administrators can deploy a custom audit policy that applies detailed security auditing settings to Windows Vista-based client computers in a Windows Server 2003 domain or in a Windows 2000 domain. If after enabling this setting, you attempt to modify an auditing setting by using Group Policy, the Group Policy auditing setting will be ignored in favor of the custom policy setting. To modify auditing settings by using Group Policy, you must first disable this key.

Important: Be very cautious about audit settings that can generate a large volume of traffic. For example, if you enable either success or failure auditing for all of the Privilege Use subcategories, the high volume of audit events generated can make it difficult to find other types of entries in the Security log. Such a configuration could also have a significant impact on system performance.

Vulnerability Details

This policy setting allows administrators to enable the more precise auditing capabilities present in Windows Vista. The Audit Policy settings available in Windows Server 2003 Active Directory do not yet contain settings for managing the new auditing subcategories. To properly apply the auditing policies prescribed in this baseline, the Audit: Force audit policy subcategory settings (Windows Vista or later) to override audit policy category settings setting needs to be configured to Enabled. The recommended state for this setting is: Enabled.

Rationale: Prior to the introduction of auditing subcategories in Windows Vista, it was difficult to track events at a per-system or per-user level. The larger event categories created too many events and the key information that needed to be audited was difficult to find.

CCE Reference Number: CCE-37850-5
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.2.1

False Positive Notes

Compliance: Ensure 'Audit Group Membership' is set to 'Success' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success:

<Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\Logon/Logoff\Audit Group Membership>

Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Vulnerability Details

This policy allows you to audit the group membership information in the users logon token. Events in this subcategory are generated on the computer on which a logon session is created. For an interactive logon, the security audit event is generated on the computer that the user logged on to. For a network logon, such as accessing a shared folder on the network, the security audit event is generated on the computer hosting the resource. The recommended state for this setting is: Success.

Note: A Windows 10, Server 2016 or higher OS is required to access and set this value in Group Policy.

Rationale: Auditing these events may be useful when investigating a security incident.

Compliance: Ensure 'Audit IPsec Driver' is set to 'Success and Failure' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure: Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\System\Audit IPsec Driver Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This subcategory reports on the activities of the Internet Protocol security (IPsec) driver. Events for this subcategory include: 4960: IPsec dropped an inbound packet that failed an integrity check. If this problem persists, it could indicate a network issue or that packets are being modified in transit to this computer. Verify that the packets sent from the remote computer are the same as those received by this computer. This error might also indicate interoperability problems with other IPsec implementations. 4961: IPsec dropped an inbound packet that failed a replay check. If this problem persists, it could indicate a replay attack against this computer. 4962: IPsec dropped an inbound packet that failed a replay check. The inbound packet had too low a sequence number to ensure it was not a replay. 4963: IPsec dropped an inbound clear text packet that should have been secured. This is usually due to the remote computer changing its IPsec policy without informing this computer. This could also be a spoofing attack attempt. 4965: IPsec received a packet from a remote computer with an incorrect Security Parameter Index (SPI). This is usually caused by malfunctioning hardware that is corrupting packets. If these errors persist, verify that the packets sent from the remote computer are the same as those received by this computer. This error may also indicate interoperability problems with other IPsec implementations. In that case, if connectivity is not impeded, then these events can be ignored. 5478: IPsec Services has started successfully. 5479: IPsec Services has been shut down successfully. The shutdown of IPsec Services can put the computer at greater risk of network attack or expose the computer to potential security risks. 5480: IPsec Services failed to get the complete list of network interfaces on the computer. This poses a potential security risk because some of the network interfaces may not get the protection provided by the applied IPsec filters. Use the IP Security Monitor snap-in to diagnose the problem. 5483: IPsec Services failed to initialize RPC server. IPsec Services could not be started. 5484: IPsec Services has experienced a critical failure and has been shut down. The shutdown of IPsec Services can put the computer at greater risk of network attack or expose the computer to potential security risks. 5485: IPsec Services failed to process some IPsec filters on a plug-and-play event for network interfaces. This poses a potential security risk because some of the network interfaces may not get the protection provided by the applied IPsec filters. Use the IP Security Monitor snap-in to diagnose the problem. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may be useful when investigating a security incident.

IPsec implementations. In that case, if connectivity is not impeded, then these events can be ignored. 5478: IPsec Services has started successfully. 5479: IPsec Services has been shut down successfully. The shutdown of IPsec Services can put the computer at greater risk of network attack or expose the computer to potential security risks. 5480: IPsec Services failed to get the complete list of network interfaces on the computer. This poses a potential security risk because some of the network interfaces may not get the protection provided by the applied IPsec filters. Use the IP Security Monitor snap-in to diagnose the problem. 5483: IPsec Services failed to initialize RPC server. IPsec Services could not be started. 5484: IPsec Services has experienced a critical failure and has been shut down. The shutdown of IPsec Services can put the computer at greater risk of network attack or expose the computer to potential security risks. 5485: IPsec Services failed to process some IPsec filters on a plug-and-play event for network interfaces. This poses a potential security risk because some of the network interfaces may not get the protection provided by the applied IPsec filters. Use the IP Security Monitor snap-in to diagnose the problem. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may be useful when investigating a security incident.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure:

<Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\System\Audit IPsec Driver>

Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success: Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\Logon/Logoff\Audit Logoff Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Vulnerability Details

This subcategory reports when a user logs off from the system. These events occur on the accessed computer. For interactive logons, the generation of these events occurs on the computer that is logged on to. If a network logon takes place to access a share, these events generate on the computer that hosts the accessed resource. If you configure this setting to No auditing, it is difficult or impossible to determine which user has accessed or attempted to access organization computers. Events for this subcategory include: 4634: An account was logged off. 4647: User initiated logoff. The recommended state for this setting is: Success.

Rationale: Auditing these events may be useful when investigating a security incident.

Compliance: Ensure 'Audit Removable Storage' is set to 'Success and Failure'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure: Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\Object Access\Audit Removable Storage Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Vulnerability Details

This policy setting allows you to audit user attempts to access file system objects on a removable storage device. A security audit event is generated only for all objects for all types of access requested. If you configure this policy setting, an audit event is generated each time an account accesses a file system object on a removable storage. Success audits record successful attempts and Failure audits record unsuccessful attempts. If you do not configure this policy setting, no audit event is generated when an account accesses a file system object on a removable storage. The recommended state for this setting is: Success and Failure.

Note: A Windows 8, Server 2012 (non-R2) or higher OS is required to access and set this value in Group Policy.

Rationale: Auditing removable storage may be useful when investigating an incident. For example, if an individual is suspected of copying sensitive information onto a USB drive.

Compliance: Ensure 'Audit Security Group Management' is set to 'Success and Failure'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure: Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\Account Management\Audit Security Group Management Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Vulnerability Details

This subcategory reports each event of security group management, such as when a security group is created, changed, or deleted or when a member is added to or removed from a security group. If you enable this Audit policy setting, administrators can track events to detect malicious, accidental, and authorized creation of security group accounts. Events for this subcategory include: 4727: A security-enabled global group was created. 4728: A member was added to a security-enabled global group. 4729: A member was removed from a security-enabled global group. 4730: A security-enabled global group was deleted. 4731: A security-enabled local group was created. 4732: A member was added to a security-enabled local group. 4733: A member was removed from a security-enabled local group. 4734: A security-enabled local group was deleted. 4735: A security-enabled local group was changed. 4737: A security-enabled global group was changed. 4754: A security-enabled universal group was created. 4755: A security-enabled universal group was changed. 4756: A member was added to a security-enabled universal group. 4757: A member was removed from a security-enabled universal group. 4758: A security-enabled universal group was deleted. 4764: A group's type was changed. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may be useful when investigating a security incident.

CCE Reference Number: CCE-38034-5

Compliance: Ensure 'Audit Security Group Management' is set to 'Success and Failure'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure:

<Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\Account Management\Audit Security Group Management>

Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. However, if audit settings are too severe, critically important entries in the Security log may be obscured by all of the meaningless entries and computer performance and the available amount of data storage may be seriously affected. Companies that operate in certain regulated industries may have legal obligations to log certain events or activities.

Compliance: Ensure 'Audit Sensitive Privilege Use' is set to 'Success and Failure'

Trivial

Vulnerability Details

This subcategory reports when a user account or service uses a sensitive privilege. A sensitive privilege includes the following user rights: Act as part of the operating system, Back up files and directories, Create a token object, Debug programs, Enable computer and user accounts to be trusted for delegation, Generate security audits, Impersonate a client after authentication, Load and unload device drivers, Manage auditing and security log, Modify firmware environment values, Replace a process-level token, Restore files and directories, and Take ownership of files or other objects. Auditing this subcategory will create a high volume of events. Events for this subcategory include: 4672: Special privileges assigned to new logon. 4673: A privileged service was called. 4674: An operation was attempted on a privileged object. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may be useful when investigating a security incident.

CCE Reference Number: CCE-36267-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 17.8.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Success and Failure: Computer Configuration\Policies\Windows Settings\Security Settings\Advanced Audit Policy Configuration\Audit Policies\Privilege Use\Audit Sensitive Privilege Use Impact: If no audit settings are configured, or if audit settings are too lax on the computers in your organization, security incidents might not be detected or not enough evidence will be available for network forensic analysis after security incidents occur. Compliance: Ensure 'Audit: Shut down system immediately if unable to log security audits' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Audit: Shut down system immediately if unable to log security audits Impact: If you enable this policy setting, the administrative burden can be significant, especially if you also configure the Retention method for the Security log to Do not overwrite events (clear log manually). This configuration causes a repudiation threat (a backup operator could deny that they backed up or restored data) to become a denial of service (DoS) vulnerability, because a server could be forced to shut down if it is overwhelmed with logon events and other security events that are written to the Security log. Also, because the shutdown is not graceful, it is possible that irreparable damage to the operating system, applications, or data could result. Although the NTFS file system guarantees its integrity when an ungraceful computer shutdown occurs, it cannot guarantee that every data file for every application will still be in a usable form when the computer restarts.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting determines whether the system shuts down if it is unable to log Security events. It is a requirement for Trusted Computer System Evaluation Criteria (TCSEC)-C2 and Common Criteria certification to prevent auditable events from occurring if the audit system is unable to log them. Microsoft has chosen to meet this requirement by halting the system and displaying a stop message if the auditing system experiences a failure. When this policy setting is enabled, the system will be shut down if a security audit cannot be logged for any reason. If the Audit: Shut down system immediately if unable to log security audits setting is enabled, unplanned system failures can occur. Therefore, this policy setting is configured to Not Defined for both of the environments that are discussed in this chapter. The recommended state for this setting is: Disabled.

Rationale: If the computer is unable to record events to the Security log, critical evidence or important troubleshooting information may not be available for review after a security incident. Also, an attacker could potentially generate a large volume of Security log events to purposely force a computer shutdown.

CCE Reference Number: CCE-35907-5

This subcategory reports each event of user account management, such as when a user account is created, changed, or deleted; a user account is renamed, disabled, or enabled; or a password is set or changed. If you enable this Audit policy setting, administrators can track events to detect malicious, accidental, and authorized creation of user accounts. Events for this subcategory include: 4720: A user account was created. 4722: A user account was enabled. 4723: An attempt was made to change an account's password. 4724: An attempt was made to reset an account's password. 4725: A user account was disabled. 4726: A user account was deleted. 4738: A user account was changed. 4740: A user account was locked out. 4765: SID History was added to an account. 4766: An attempt to add SID History to an account failed. 4767: A user account was unlocked. 4780: The ACL was set on accounts which are members of administrators groups. 4781: The name of an account was changed: 4794: An attempt was made to set the Directory Services Restore Mode. 5376: Credential Manager credentials were backed up. 5377: Credential Manager credentials were restored from a backup. The recommended state for this setting is: Success and Failure.

Rationale: Auditing these events may be useful when investigating a security incident.

Compliance: Ensure 'Automatically send memory dumps for OS-generated error reports' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Error Reporting\Automatically send memory dumps for OS-generated error reports Impact: If you disable this policy setting, then all memory dumps are uploaded according to the default consent and notification settings.

Vulnerability Details

This policy setting controls whether memory dumps in support of OS-generated error reports can be sent to Microsoft automatically. This policy does not apply to error reports generated by 3rd-party products, or additional data other than memory dumps. The recommended state for this setting is: Disabled.

Rationale: Memory dumps may contain sensitive information and should not be automatically sent to anyone.

CCE Reference Number: CCE-36978-5
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.67.3

Compliance: Ensure 'Back up files and directories' is set to 'Administrators'

Trivial

Vulnerability Details

This policy setting allows users to circumvent file and directory permissions to back up the system. This user right is enabled only when an application (such as NTBACKUP) attempts to access a file or directory through the NTFS file system backup application programming interface (API). Otherwise, the assigned file and directory permissions apply. The recommended state for this setting is: Administrators.

Rationale: Users who are able to back up data from a computer could take the backup media to a non-domain computer on which they have administrative privileges and restore the data. They could take ownership of the files and view any unencrypted data that is contained within the backup set.

CCE Reference Number: CCE-35912-5
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.8

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators. Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Back up files and directories Impact: Changes in the membership of the groups that have the Back up files and directories user right could limit the abilities of users who are assigned to specific administrative roles in your environment. You should confirm that authorized backup administrators are still able to perform backup operations.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Block launching Windows Store apps with Windows Runtime API access from hosted content.' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\App runtime\Block launching Windows Store apps with Windows Runtime API access from hosted content.>

Impact: Windows Store apps with Windows Runtime API access directly from web content cannot be launched (Windows Store apps without Windows Runtime API access from web content will not be affected).

Vulnerability Details

This policy setting controls whether Windows Store apps with Windows Runtime API access directly from web content can be launched. The recommended state for this setting is: Enabled.

Rationale: Blocking Apps from the web with direct access to the Windows API can prevent malicious apps from being run on a system. Only system administrators should be installing approved applications. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.6.2

Compliance: Ensure 'Block user from showing account details on sign-in' is set to 'Enabled' — Trivial

Vulnerability Details

This policy prevents the user from showing account details (email address or user name) on the sign-in screen. The recommended state for this setting is: Enabled.

Rationale: An attacker with access to the console (for example, someone with physical access or someone who is able to connect to the server through Terminal Services) could view the name of the last user who logged on to the server. The attacker could then try to guess the password, use a dictionary, or use a brute-force attack to try and log on.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.25.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to Enabled:

Computer Configuration\Policies\Administrative Templates\System\Logon\Block user from showing account details on sign-in

Note: This Group Policy path does not exist by default. An updated Group Policy template (Logon.admx/adml) is required - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer).

Impact: The user cannot choose to show account details on the sign-in screen.

Compliance: Ensure 'Boot-Start Driver Initialization Policy' is set to 'Enabled: Good, unknown and bad but critical'	Trivial

Vulnerability Details

This policy setting allows you to specify which boot-start drivers are initialized based on a classification determined by an Early Launch Antimalware boot-start driver. The Early Launch Antimalware boot-start driver can return the following classifications for each boot-start driver: Good: The driver has been signed and has not been tampered with. Bad: The driver has been identified as malware. It is recommended that you do not allow known bad drivers to be initialized. Bad, but required for boot: The driver has been identified as malware, but the computer cannot successfully boot without loading this driver. Unknown: This driver has not been attested to by your malware detection application and has not been classified by the Early Launch Antimalware boot-start driver. If you enable this policy setting you will be able to choose which boot-start drivers to initialize the next time the computer is started. If you disable or do not configure this policy setting, the boot start drivers determined to be Good, Unknown or Bad but Boot Critical are initialized and the initialization of drivers determined to be Bad is skipped. If your malware detection application does not include an Early Launch Antimalware boot-start driver or if your Early Launch Antimalware boot-start driver has been disabled, this setting has no effect and all boot-start drivers are initialized. The recommended state for this setting is: Enabled: Good, unknown and bad but critical.

Rationale: This policy setting helps reduce the impact of malware that has already infected your system.

CCE Reference Number: CCE-37912-3

Compliance: Ensure 'Change the system time' is set to 'Administrators, LOCAL SERVICE'	**Trivial**

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators, LOCAL SERVICE: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Change the system time Impact: There should be no impact, because time synchronization for most organizations should be fully automated for all computers that belong to the domain. Computers that do not belong to the domain should be configured to synchronize with an external source.

Vulnerability Details

This policy setting determines which users and groups can change the time and date on the internal clock of the computers in your environment. Users who are assigned this user right can affect the appearance of event logs. When a computer's time setting is changed, logged events reflect the new time, not the actual time that the events occurred. When configuring a user right in the SCM enter a comma delimited list of accounts. Accounts can be either local or located in Active Directory, they can be groups, users, or computers.

Note: Discrepancies between the time on the local computer and on the domain controllers in your environment may cause problems for the Kerberos authentication protocol, which could make it impossible for users to log on to the domain or obtain authorization to access domain resources after they are logged on. Also, problems will occur when Group Policy is applied to client computers if the system time is not synchronized with the domain controllers. The recommended state for this setting is: Administrators, LOCAL SERVICE.

Rationale: Users who can change the time on a computer could cause several problems. For example, time stamps on event log entries could be made inaccurate, time stamps on files and folders that are created or modified could be incorrect, and computers that belong to a domain may not be able to authenticate themselves or users who try to log on to the domain from them. Also, because the Kerberos authentication protocol requires that the requestor and authenticator have their clocks synchronized within an administrator-defined skew period, an attacker who changes a computer's time may cause that computer to be unable to obtain or grant Kerberos tickets.The risk from these types of events is mitigated on most domain controllers, member servers, and end-user computers because the Windows Time service automatically synchronizes time with domain controllers in the following ways:#x2022; All client desktop computers and member servers use the authenticating domain controller as their inbound time partner.#x2022; All domain controllers in a domain nominate the primary domain controller (PDC) emulator operations master as their inbound time partner.#x2022; All PDC emulator operations masters follow the hierarchy of domains in the selection of their inbound time partner.#x2022; The PDC emulator operations master at the root of the domain is authoritative for the organization. Therefore it is recommended that you configure this computer to synchronize with a reliable external time server.This vulnerability becomes much more serious if an attacker is able to change the system time and then stop the Windows Time service or reconfigure it to synchronize with a time server that is not accurate.

Compliance: Ensure 'Configuration of wireless settings using Windows Connect Now' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Network\Windows Connect Now\Configuration of wireless settings using Windows Connect Now>

Impact: WCN operations are disabled over all media.

Vulnerability Details

This policy setting allows the configuration of wireless settings using Windows Connect Now (WCN). The WCN Registrar enables the discovery and configuration of devices over Ethernet (UPnP) over In-band 802.11 Wi-Fi through the Windows Portable Device API (WPD) and via USB Flash drives. Additional options are available to allow discovery and configuration over a specific medium. The recommended state for this setting is: Disabled.

Rationale: This setting enhances the security of the environment and reduces the overall risk exposure related to user configuration of wireless settings.

CCE Reference Number: CCE-37481-9

Compliance: Ensure 'Configure Automatic Updates' is set to 'Enabled' Trivial

Vulnerability Details

This policy setting specifies whether computers in your environment will receive security updates from Windows Update or WSUS. If you configure this policy setting to Enabled, the operating system will recognize when a network connection is available and then use the network connection to search Windows Update or your designated intranet site for updates that apply to them. After you configure this policy setting to Enabled, select one of the following three options in the Configure Automatic Updates Properties dialog box to specify how the service will work:- Notify before downloading any updates and notify again before installing them.- Download the updates automatically and notify when they are ready to be installed. (Default setting)- Automatically download updates and install them on the schedule specified below. If you disable this policy setting, you will need to download and manually install any available updates from Windows Update. The recommended state for this setting is: Enabled.

Rationale: Although each version of Windows is thoroughly tested before release, it is possible that problems will be discovered after the products are shipped. The Configure Automatic Updates setting can help you ensure that the computers in your environment will always have the most recent critical operating system updates and service packs installed.

CCE Reference Number: CCE-36172-5
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.85.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Update\Configure Automatic Updates Impact: Critical operating system updates and service packs will automatically download and install at 3:00 A.M. daily.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Configure Automatic Updates' is set to 'Enabled' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Windows

Update\Configure Automatic Updates>

Impact: Critical operating system updates and service packs will be installed as necessary.

Vulnerability Details

This policy setting specifies whether computers in your environment will receive security updates from Windows Update or WSUS. If you configure this policy setting to Enabled, the operating system will recognize when a network connection is available and then use the network connection to search Windows Update or your designated intranet site for updates that apply to them. After you configure this policy setting to Enabled, select one of the following three options in the Configure Automatic Updates Properties dialog box to specify how the service will work: - Notify before downloading any updates and notify again before installing them. - Download the updates automatically and notify when they are ready to be installed. (Default setting) - Automatically download updates and install them on the schedule specified below. The recommended state for this setting is: Enabled.

Note: The sub-setting "Configure automatic updating:" has 4 possible values all of them are valid depending on organizational needs, however if feasible we suggest using a value of 4 - Auto download and schedule the install. This suggestion is not a scored requirement.

Rationale: Although each version of Windows is thoroughly tested before release, it is possible that problems will be discovered after the products are shipped. The Configure Automatic Updates setting can help you ensure that the computers in your environment will always have the most recent critical operating system updates and service packs installed.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Always ask before sending data: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Error Reporting\Consent\Configure Default consent Impact: By setting to always ask before sending data: Windows prompts users for consent to send reports.

Vulnerability Details

This setting allows you to set the default consent handling for error reports. The recommended state for this setting is: Enabled: Always ask before sending data

Rationale: Error reports may contain sensitive information and should not be sent to anyone automatically.

Compliance: Ensure 'Configure Offer Remote Assistance' is set to 'Disabled'

Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\System\Remote Assistance\Configure Offer Remote Assistance Impact: Help desk and support personnel will not be able to proactively offer assistance, although they can still respond to user assistance requests.

Vulnerability Details

This policy setting allows you to turn on or turn off Offer (Unsolicited) Remote Assistance on this computer. If you enable this policy setting, users on this computer can get help from their corporate technical support staff using Offer (Unsolicited) Remote Assistance. If you disable this policy setting, users on this computer cannot get help from their corporate technical support staff using Offer (Unsolicited) Remote Assistance. If you do not configure this policy setting, users on this computer cannot get help from their corporate technical support staff using Offer (Unsolicited) Remote Assistance. If you enable this policy setting, you have two ways to allow helpers to provide Remote Assistance: "Allow helpers to only view the computer" or "Allow helpers to remotely control the computer." When you configure this policy setting, you also specify the list of users or user groups that are allowed to offer remote assistance. To configure the list of helpers, click "Show." In the window that opens, you can enter the names of the helpers. Add each user or group one by one. When you enter the name of the helper user or user groups, use the following format:<Domain Name>\<User Name> or<Domain Name>\<Group Name> If you enable this policy setting, you should also enable firewall exceptions to allow Remote Assistance communications. The firewall exceptions required for Offer (Unsolicited) Remote Assistance depend on the version of Windows you are running: Windows Vista and later:Enable the Remote Assistance exception for the domain profile.

The exception must contain:Port 135:TCP%WINDIR%\System32\msra.exe%WINDIR%\System32\raserver.exe Windows XP with Service Pack 2 (SP2) and Windows XP Professional x64 Edition with Service Pack 1 (SP1):Port 135:TCP%WINDIR%\PCHealth\HelpCtr\Binaries\Helpsvc.exe%WINDIR%\PCHealth\HelpCtr\Binaries\He
For computers running Windows Server 2003 with Service Pack 1 (SP1)Port 135:TCP%WINDIR%\PCHealth\HelpCtr\Binaries\Helpsvc.exe%WINDIR%\PCHealth\HelpCtr\Binaries\He
Remote Desktop Exception The recommended state for this setting is: Disabled.

Rationale: A user might be tricked and accept an unsolicited Remote Assistance offer from a malicious user.

CCE Reference Number: CCE-36388-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.8.30.1

Compliance: Ensure 'Configure Password Manager' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Microsoft Edge\Configure Password Manager>

Impact: Employees will not be able to use Password Manager.

Vulnerability Details

This setting lets you decide whether employees can save their passwords locally, using Password

Manager. The recommended state for this setting is: Disabled.

Rationale: Using Password Manager can potentially makes it easier for an unauthorized user who gains access to the users desktop (including a coworker who sits down at a users desk soon after the user walks away and forgets to lock their workstation), to log in to sites as the user, without needing to know or enter the password. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.41.4

Compliance: Ensure 'Configure Pop-up Blocker' is set to 'Enabled' Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Microsoft Edge\Configure Pop-up Blocker>

Impact: None - this is the default configuration.

Vulnerability Details

This setting lets you decide whether to turn on Pop-up Blocker and whether to allow pop-ups to appear in secondary windows. The recommended state for this setting is: Enabled.

Rationale: The Pop-up Blocker serves an important purpose by blocking malicious popups and helping prevent the machine from being compromised. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.41.5

Compliance: Ensure 'Configure registry policy processing: Do not apply during periodic background processing' is set to 'Enabled: FALSE'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled, then set the Do not apply during periodic background processing option to FALSE (unchecked): Computer Configuration\Policies\Administrative Templates\System\Group Policy\Configure registry policy processing Impact: Group Policies will be reapplied every time they are refreshed, which could have a slight impact on performance.

Vulnerability Details

The "Do not apply during periodic background processing" option prevents the system from updating affected policies in the background while the computer is in use. When background updates are disabled, policy changes will not take effect until the next user logon or system restart. The recommended state for this setting is: Enabled: FALSE (unchecked).

Rationale: Setting this option to false (unchecked) will ensure that domain policy changes take effect more quickly, as compared to waiting until the next user logon or system restart.

CCE Reference Number: CCE-36169-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.8.18.2

Compliance: Ensure 'Configure registry policy processing: Process even if the Group Policy objects have not changed' is set to 'Enabled: TRUE'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled, then set the Process even if the Group Policy objects have not changed option to TRUE (checked): Computer Configuration\Policies\Administrative Templates\System\Group Policy\Configure registry policy processing Impact: Group Policies will be reapplied every time they are refreshed, which could have a slight impact on performance.

Vulnerability Details

The "Process even if the Group Policy objects have not changed" option updates and reapplies policies even if the policies have not changed. The recommended state for this setting is: Enabled: TRUE (checked).

Rationale: Setting this option to true (checked) will ensure unauthorized changes that might have been configured locally are forced to match the domain-based Group Policy settings again.

CCE Reference Number: CCE-36169-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.8.18.3

Compliance: Ensure 'Configure Solicited Remote Assistance' is set to 'Disabled' — Trivial

Vulnerability Details

This policy setting allows you to turn on or turn off Solicited (Ask for) Remote Assistance on this computer. If you enable this policy setting, users on this computer can use email or file transfer to ask someone for help. Also, users can use instant messaging programs to allow connections to this computer, and you can configure additional Remote Assistance settings. If you disable this policy setting, users on this computer cannot use email or file transfer to ask someone for help. Also, users cannot use instant messaging programs to allow connections to this computer. If you do not configure this policy setting, users can turn on or turn off Solicited (Ask for) Remote Assistance themselves in System Properties in Control Panel. Users can also configure Remote Assistance settings. If you enable this policy setting, you have two ways to allow helpers to provide Remote Assistance: "Allow helpers to only view the computer" or "Allow helpers to remotely control the computer." The "Maximum ticket time" policy setting sets a limit on the amount of time that a Remote Assistance invitation created by using email or file transfer can remain open. The "Select the method for sending email invitations" setting specifies which email standard to use to send Remote Assistance invitations. Depending on your email program, you can use either the Mailto standard (the invitation recipient connects through an Internet link) or the SMAPI (Simple MAPI) standard (the invitation is attached to your email message). This policy setting is not available in Windows Vista since SMAPI is the only method supported. If you enable this policy setting you should also enable appropriate firewall exceptions to allow Remote Assistance communications. The recommended state for this setting is: Disabled.

Rationale: There is slight risk that a rogue administrator will gain access to another user's desktop session, however, they cannot connect to a user's computer unannounced or control it without permission from the user. When an expert tries to connect, the user can still choose to deny the connection or give the expert view-only privileges. The user must explicitly click the Yes button to allow the expert to remotely control the workstation.

CCE Reference Number: CCE-37281-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.8.30.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\System\Remote Assistance\Configure Solicited Remote Assistance Impact: If you enable this policy, users on this computer can use email or file transfer to ask someone for help. Also, users can use instant messaging programs to allow connections to this computer, and you can configure additional Remote Assistance settings. If you disable this policy, users on this computer cannot use email or file transfer to ask someone for help. Also, users cannot use instant messaging programs to allow connections to this computer. If you don't configure this policy, users can enable or disable Solicited (Ask for) Remote Assistance themselves in System Properties in Control Panel. Users can also configure Remote Assistance settings.

Compliance: Ensure 'Configure Watson events' is set to 'Disabled' — Trivial

Vulnerability Details

This policy setting allows you to configure whether or not Watson events are sent. The recommended state for this setting is: Disabled.

Rationale: Watson events are the reports that get sent to Microsoft when a program or service crashes or fails, including the possibility of automatic submission. Preventing this information from being sent can help reduce privacy concerns.

CCE Reference Number: CCE-36950-4
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.69.8.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Defender\Reporting\Configure Watson events

Note: This Group Policy path does not exist by default. An updated Group Policy template (WindowsDefender.admx/adml) is required - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer).

Impact: Watson events will not be sent to Microsoft automatically when a program or service crashes or fails.

Compliance: Ensure 'Configure Windows SmartScreen' is set to 'Enabled' — Trivial

Vulnerability Details

This policy setting allows you to manage the behavior of Windows SmartScreen. Windows SmartScreen helps keep PCs safer by warning users before running unrecognized programs downloaded from the Internet. Some information is sent to Microsoft about files and programs run on PCs with this feature enabled. The recommended state for this setting is: Enabled.

Rationale: Windows SmartScreen helps keep PCs safer by warning users before running unrecognized programs downloaded from the Internet. However, due to the fact that some information is sent to Microsoft about files and programs run on PCs some organizations may prefer to disable it.

CCE Reference Number: CCE-35859-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.30.2

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\File Explorer\Configure Windows SmartScreen>

Impact: Only administrators will be able to run unrecognized programs downloaded from the Internet. If users with a standard account try, they won't be able to unless they get an administrator to authorize it.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Configure Windows SmartScreen' is set to 'Enabled: Require approval from an administrator before running downloaded unknown software' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Enabled: Require approval from an administrator before running downloaded unknown software: Computer Configuration\Policies\Administrative Templates\Windows Components\File Explorer\Configure Windows SmartScreen Impact: Only administrators will be able to run unrecognized programs downloaded from the Internet. If users with a standard account try, they won't be able to unless they get an administrator to authorize it.

Vulnerability Details

This policy setting allows you to manage the behavior of Windows SmartScreen. Windows SmartScreen helps keep PCs safer by warning users before running unrecognized programs downloaded from the Internet. Some information is sent to Microsoft about files and programs run on PCs with this feature enabled. If you enable this policy setting, Windows SmartScreen behavior may be controlled by setting one of the following options: Require approval from an administrator before running downloaded unknown software Give user a warning before running downloaded unknown software Turn off SmartScreen If you disable or do not configure this policy setting, Windows SmartScreen behavior is managed by administrators on the PC by using Windows SmartScreen Settings in Action Center. The recommended state for this setting is: Enabled: Require approval from an administrator before running downloaded unknown software.

Rationale: Windows SmartScreen helps keep PCs safer by warning users before running unrecognized programs downloaded from the Internet. However, due to the fact that some information is sent to Microsoft about files and programs run on PCs some organizations may prefer to disable it.

Compliance: Ensure 'Continue experiences on this device' is set to 'Disabled'

Trivial

Vulnerability Details

This policy setting determines whether the Windows device is allowed to participate in cross-device experiences (continue experiences). The recommended state for this setting is: Disabled.

Rationale: A cross-device experience is when a system can access app and send messages to other

devices. In an enterprise environment only trusted systems should be communicating within the network. Access to any other system should be prohibited.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.19.4

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\System\Group Policy\Continue experiences on this device>

Impact: The Windows device will not be discoverable by other devices, and cannot participate in cross-device experiences.

Compliance: Ensure 'Create a token object' is set to 'No One' — Trivial

Vulnerability Details

This policy setting allows a process to create an access token, which may provide elevated rights to access sensitive data. The recommended state for this setting is: No One.

Rationale: A user account that is given this user right has complete control over the system and can lead to the system being compromised. It is highly recommended that you do not assign any user accounts this right. The operating system examines a user's access token to determine the level of the user's privileges. Access tokens are built when users log on to the local computer or connect to a remote computer over a network. When you revoke a privilege, the change is immediately recorded, but the change is not reflected in the user's access token until the next time the user logs on or connects. Users with the ability to create or modify tokens can change the level of access for any currently logged on account. They could escalate their own privileges or create a DoS condition.

CCE Reference Number: CCE-36861-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.12

Compliance: Ensure 'Create global objects' is set to 'Administrators, LOCAL SERVICE, NETWORK SERVICE, SERVICE'

Trivial

Vulnerability Details

This policy setting determines whether users can create global objects that are available to all sessions. Users can still create objects that are specific to their own session if they do not have this user right. Users who can create global objects could affect processes that run under other users' sessions. This capability could lead to a variety of problems, such as application failure or data corruption. The recommended state for this setting is: Administrators, LOCAL SERVICE, NETWORK SERVICE, SERVICE.

Rationale: Users who can create global objects could affect Windows services and processes that run under other user or system accounts. This capability could lead to a variety of problems, such as application failure, data corruption and elevation of privilege.

CCE Reference Number: CCE-37453-8

Compliance: Ensure 'Create global objects' is set to 'Administrators, LOCAL SERVICE, NETWORK SERVICE, SERVICE' Trivial

Vulnerability Details

This policy setting determines whether users can create global objects that are available to all sessions. Users can still create objects that are specific to their own session if they do not have this user right. Users who can create global objects could affect processes that run under other users' sessions. This capability could lead to a variety of problems, such as application failure or data corruption. The recommended state for this setting is: Administrators, LOCAL SERVICE, NETWORK SERVICE, SERVICE.

Note: A Member Server with Microsoft SQL Server and its optional "Integration Services" component installed will require a special exception to this recommendation for additional SQL-generated entries to be granted this user right.

Rationale: Users who can create global objects could affect Windows services and processes that run under other user or system accounts. This capability could lead to a variety of problems, such as application failure, data corruption and elevation of privilege.

CCE Reference Number: CCE-37453-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.13

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators, LOCAL SERVICE, NETWORK SERVICE, SERVICE:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Create global objects>

Impact: None - this is the default configuration.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Ensure 'Create permanent shared objects' is set to 'No One' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to No One: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Create permanent shared objects Impact: None. This is the default configuration.

Vulnerability Details

This user right is useful to kernel-mode components that extend the object namespace. However, components that run in kernel mode have this user right inherently. Therefore, it is typically not necessary to specifically assign this user right. The recommended state for this setting is: No One.

Rationale: Users who have the Create permanent shared objects user right could create new shared objects and expose sensitive data to the network.

CCE Reference Number: CCE-36532-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.14

False Positive Notes

Compliance: Ensure 'Debug programs' is set to 'Administrators' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Debug programs Impact: If you revoke this user right, no one will be able to debug programs. However, typical circumstances rarely require this capability on production computers. If a problem arises that requires an application to be debugged on a production server, you can move the server to a different OU temporarily and assign the Debug programs user right to a separate Group Policy for that OU. The service account that is used for the cluster service needs the Debug programs privilege; if it does not have it, Windows Clustering will fail. For additional information about how to configure Windows Clustering in conjunction with computer hardening, see Microsoft Knowledge Base article 891597: How to apply more restrictive security settings on a Windows Server 2003-based cluster server. Tools that are used to manage processes will be unable to affect processes that are not owned by the person who runs the tools. For example, the Windows Server 2003 Resource Kit tool Kill.exe requires this user right for administrators to terminate processes that they did not start.

Vulnerability Details

This policy setting determines which user accounts will have the right to attach a debugger to any process or to the kernel, which provides complete access to sensitive and critical operating system components. Developers who are debugging their own applications do not need to be assigned this user right; however, developers who are debugging new system components will need it. The recommended state for this setting is: Administrators.

Rationale: The Debug programs user right can be exploited to capture sensitive computer information from system memory, or to access and modify kernel or application structures. Some attack tools exploit this user right to extract hashed passwords and other private security information, or to insert rootkit code. By default, the Debug programs user right is assigned only to administrators, which helps to mitigate the risk from this vulnerability.

CCE Reference Number: CCE-37075-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.16

False Positive Notes

Compliance: Ensure 'Default Action and Mitigation Settings' is set to 'Enabled' (plus subsettings)	Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\EMET\Default Action and Mitigation Settings Note: This Group Policy path does not exist by default. An additional Group Policy template (EMET.admx/adml) is required - it is included with Microsoft Enhanced Mitigation Experience Toolkit (EMET).

Vulnerability Details

This setting configures the default action after detection and advanced ROP mitigation. The recommended state for this setting is: Default Action and Mitigation Settings - Enabled Deep Hooks - Enabled Anti Detours - Enabled Banned Functions - Enabled Exploit Action - User Configured

Rationale: These advanced mitigations for ROP mitigations apply to all configured software in EMET. Deep Hooks protects critical APIs and the subsequent lower level APIs used by the top level critical API. Anti Detours renders ineffective exploits that evade hooks by executing a copy of the hooked function prologue and then jump to the function past the prologue. Banned Functions will block calls to ntdll!LdrHotPatchRoutine to mitigate potential exploits abusing the API.

Compliance: Ensure 'Deny log on as a batch job' to include 'Guests' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to include Guests: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Deny log on as a batch job Impact: If you assign the Deny log on as a batch job user right to other accounts, you could deny users who are assigned to specific administrative roles the ability to perform their required job activities. You should confirm that delegated tasks will not be affected adversely. For example, if you assign this user right to the IWAM_<ComputerName> account, the MSM Management Point will fail. On a newly installed computer that runs Windows Server 2003 this account does not belong to the Guests group, but on a computer that was upgraded from Windows 2000 this account is a member of the Guests group. Therefore, it is important that you understand which accounts belong to any groups that you assign the Deny log on as a batch job user right.

Vulnerability Details

This policy setting determines which accounts will not be able to log on to the computer as a batch job. A batch job is not a batch (.bat) file, but rather a batch-queue facility. Accounts that use the Task Scheduler to schedule jobs need this user right. The Deny log on as a batch job user right overrides the Log on as a batch job user right, which could be used to allow accounts to schedule jobs that consume excessive system resources. Such an occurrence could cause a DoS condition. Failure to assign this user right to the recommended accounts can be a security risk. The recommended state for this setting is to include: Guests.

Rationale: Accounts that have the Deny log on as a batch job user right could be used to schedule jobs that could consume excessive computer resources and cause a DoS condition.

CCE Reference Number: CCE-36923-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.18

Compliance: Ensure 'Deny log on as a service' to include 'Guests' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to include Guests: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Deny log on as a service Impact: If you assign the Deny log on as a service user right to specific accounts, services may not be able to start and a DoS condition could result.

Vulnerability Details

This security setting determines which service accounts are prevented from registering a process as a service. This policy setting supersedes the Log on as a service policy setting if an account is subject to both policies. The recommended state for this setting is to include: Guests.

Note: This security setting does not apply to the System, Local Service, or Network Service accounts.

Rationale: Accounts that can log on as a service could be used to configure and start new unauthorized services, such as a keylogger or other malicious software. The benefit of the specified countermeasure is somewhat reduced by the fact that only users with administrative privileges can install and configure services, and an attacker who has already attained that level of access could configure the service to run with the System account.

CCE Reference Number: CCE-36877-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.19

Compliance: Ensure 'Deny log on locally' to include 'Guests' — Trivial

Vulnerability Details

This security setting determines which users are prevented from logging on at the computer. This policy setting supersedes the Allow log on locally policy setting if an account is subject to both policies. Important: If you apply this security policy to the Everyone group, no one will be able to log on locally. The recommended state for this setting is to include: Guests.

Rationale: Any account with the ability to log on locally could be used to log on at the console of the computer. If this user right is not restricted to legitimate users who need to log on to the console of the computer, unauthorized users might download and run malicious software that elevates their privileges.

CCE Reference Number: CCE-37146-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.20

Solution Details

To establish the recommended configuration via GP, set the following UI path to include Guests: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Deny log on locally Impact: If you assign the Deny log on locally user right to additional accounts, you could limit the abilities of users who are assigned to specific roles in your environment. However, this user right should explicitly be assigned to the ASPNET account on computers that run IIS 6.0. You should confirm that delegated activities will not be adversely affected.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Deny log on through Remote Desktop Services' to include 'Guests, Local account'

Trivial

Vulnerability Details

This policy setting determines whether users can log on as Terminal Services clients. After the baseline member server is joined to a domain environment, there is no need to use local accounts to access the server from the network. Domain accounts can access the server for administration and end-user processing. The recommended state for this setting is to include: Guests, Local account.

Caution: Configuring a standalone (non-domain-joined) server as described above may result in an inability to remotely administer the server.

Rationale: Any account with the right to log on through Terminal Services could be used to log on to the remote console of the computer. If this user right is not restricted to legitimate users who need to log on to the console of the computer, unauthorized users might download and run malicious software that elevates their privileges.

CCE Reference Number: CCE-36867-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.21

Solution Details

To establish the recommended configuration via GP, set the following UI path to include Guests, Local account: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Deny log on through Remote Desktop Services Impact: If you assign the Deny log on through Terminal Services user right to other groups, you could limit the abilities of users who are assigned to specific administrative roles in your environment. Accounts that have this user right will be unable to connect to the computer through either Terminal Services or Remote Assistance. You should confirm that delegated tasks will not be negatively impacted.

Compliance: Ensure 'Devices: Allowed to format and eject removable media' is set to 'Administrators'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Devices: Allowed to format and eject removable media Impact: None - this is the default value. Only Administrators will be able to format and eject removable NTFS media.

Vulnerability Details

This policy setting determines who is allowed to format and eject removable NTFS media. You can use this policy setting to prevent unauthorized users from removing data on one computer to access it on another computer on which they have local administrator privileges. The recommended state for this setting is: Administrators.

Rationale: Users may be able to move data on removable disks to a different computer where they have administrative privileges. The user could then take ownership of any file, grant themselves full control, and view or modify any file. The fact that most removable storage devices will eject media by pressing a mechanical button diminishes the advantage of this policy setting.

CCE Reference Number: CCE-37701-0

Compliance: Ensure 'Devices: Prevent users from installing printer drivers' is set to 'Enabled'

Trivial

Vulnerability Details

For a computer to print to a shared printer, the driver for that shared printer must be installed on the local computer. This security setting determines who is allowed to install a printer driver as part of connecting to a shared printer. If this setting is enabled, only Administrators can install a printer driver as part of connecting to a shared printer. If this setting is disabled, any user can install a printer driver as part of connecting to a shared printer. The recommended state for this setting is: Enabled.

Note: This setting does not affect the ability to add a local printer. This setting does not affect Administrators.

Rationale: It may be appropriate in some organizations to allow users to install printer drivers on their own workstations. However, you should allow only Administrators, not users, to do so on servers, because printer driver installation on a server may unintentionally cause the computer to become less stable. A malicious user could install inappropriate printer drivers in a deliberate attempt to damage the computer, or a user might accidentally install malicious software that masquerades as a printer driver. It is feasible for an attacker to disguise a Trojan horse program as a printer driver. The program may appear to users as if they must use it to print, but such a program could unleash malicious code on your computer network.

CCE Reference Number: CCE-37942-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.4.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Devices: Prevent users from installing printer drivers Impact: Only Administrators will be able to install a printer driver as part of connecting to a shared printer. The ability to add a local printer will not be affected.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Devices: Prevent users from installing printer drivers' is set to 'Enabled'

Trivial

Vulnerability Details

For a computer to print to a shared printer, the driver for that shared printer must be installed on the local computer. This security setting determines who is allowed to install a printer driver as part of connecting to a shared printer. The recommended state for this setting is: Enabled.

Note: This setting does not affect the ability to add a local printer. This setting does not affect Administrators.

Rationale: It may be appropriate in some organizations to allow users to install printer drivers on their own workstations. However, you should allow only Administrators, not users, to do so on servers, because printer driver installation on a server may unintentionally cause the computer to become less stable. A malicious user could install inappropriate printer drivers in a deliberate attempt to damage the computer, or a user might accidentally install malicious software that masquerades as a printer driver. It is feasible for an attacker to disguise a Trojan horse program as a printer driver. The program may appear to users as if they must use it to print, but such a program could unleash malicious code on your computer network.

CCE Reference Number: CCE-37942-0
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.4.2

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Devices: Prevent users from installing printer drivers>

Impact: None - this is the default configuration.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Disable all apps from Windows Store' is set to 'Enabled' — Trivial

Vulnerability Details

This setting configures the launch of all apps from the Windows Store that came pre-installed or were downloaded. The recommended state for this setting is: Enabled.

Rationale: The Store service is a retail outlet built into Windows, primarily for consumer use. In an enterprise environment the IT department should be managing the installation of all applications to reduce the risk of the installation of vulnerable software.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.61.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Store\Disable all apps from Windows Store>

Impact: All apps from the Windows Store that came pre-installed or were downloaded are prevented from launching. Existing Windows Store apps will not be updated. Windows Store is disabled.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Disable pre-release features or settings' is set to 'Disabled' — Trivial

Vulnerability Details

This policy setting determines the level that Microsoft can experiment with the product to study user preferences or device behavior. A value of 1 permits Microsoft to configure device settings only. A value of 2 allows Microsoft to conduct full experimentations. The recommended state for this setting is: Disabled.

Rationale: It can be dangerous in an Enterprise environment if experimental features are allowed because this can introduce bugs and security holes into systems, making it easier for an attacker to gain access. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.16.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Data Collection and Preview Builds\Disable pre-release features or settings Note: This Group Policy path does not exist by default. An additional Group Policy template (datacollection.admx/adml) is required - it is included with the Microsoft Windows 10 Administrative Templates. Impact: All experimentations will be turned off.

CVSS Base Score: 0

Compliance: Ensure 'Disallow Digest authentication' is set to 'Enabled'	Trivial

Vulnerability Details

This policy setting allows you to manage whether the Windows Remote Management (WinRM) client will not use Digest authentication. If you enable this policy setting, the WinRM client will not use Digest authentication. If you disable or do not configure this policy setting, the WinRM client will use Digest authentication. The recommended state for this setting is: Enabled.

Rationale: Digest authentication is less robust than other authentication methods available in WinRM, an attacker who is able to capture packets on the network where WinRM is running may be able to determine the credentials used for accessing remote hosts via WinRM.

CCE Reference Number: CCE-38318-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.81.1.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Remote Management (WinRM)\WinRM Client\Disallow Digest authentication Impact: The WinRM client will not use Digest authentication.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Disallow WinRM from storing RunAs credentials' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Remote Management (WinRM)\WinRM Service\Disallow WinRM from storing RunAs credentials Impact: The WinRM service will not allow the RunAsUser or RunAsPassword configuration values to be set for any plug-ins. If a plug-in has already set the RunAsUser and RunAsPassword configuration values, the RunAsPassword configuration value will be erased from the credential store on this computer. If this setting is later Disabled again, any values that were previously configured for RunAsPassword will need to be reset.

Vulnerability Details

This policy setting allows you to manage whether the Windows Remote Management (WinRM) service will not allow RunAs credentials to be stored for any plug-ins. If you enable this policy setting, the WinRM service will not allow the RunAsUser or RunAsPassword configuration values to be set for any plug-ins. If a plug-in has already set the RunAsUser and RunAsPassword configuration values, the RunAsPassword configuration value will be erased from the credential store on this computer. If you disable or do not configure this policy setting, the WinRM service will allow the RunAsUser and RunAsPassword configuration values to be set for plug-ins and the RunAsPassword value will be stored securely. If you enable and then disable this policy setting, any values that were previously configured for RunAsPassword will need to be reset. The recommended state for this setting is: Enabled.

Rationale: Although the ability to store RunAs credentials is a convenient feature it increases the risk of account compromise slightly. For example, if you forget to lock your desktop before leaving it unattended for a few minutes another person could access not only the desktop of your computer but also any hosts you manage via WinRM with cached RunAs credentials.

CCE Reference Number: CCE-36000-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.81.2.3

Compliance: Ensure 'Domain controller: Allow server operators to schedule tasks' is set to 'Disabled' (DC only) — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Domain controller: Allow server operators to schedule tasks>

Impact: The impact should be small for most organizations. Users (including those in the Server Operators group) will still be able to create jobs by means of the Task Scheduler Wizard. However, those jobs will run in the context of the account that the user authenticates with when setting up the job.

Vulnerability Details

This policy setting determines whether members of the Server Operators group are allowed to submit jobs by means of the AT schedule facility. The impact of this policy setting configuration should be small for most organizations. Users, including those in the Server Operators group, will still be able to create jobs by means of the Task Scheduler Wizard, but those jobs will run in the context of the account with which the user authenticates when they set up the job.

Note: An AT Service Account can be modified to select a different account rather than the LOCAL SYSTEM account. To change the account, open System Tools, click Scheduled Tasks, and then click Accessories folder. Then click AT Service Account on the Advanced menu. The recommended state for this setting is: Disabled.

Rationale: If you enable this policy setting, jobs that are created by server operators by means of the AT service will execute in the context of the account that runs that service. By default, that is the local SYSTEM account. If you enable this policy setting, server operators could perform tasks that SYSTEM is able to do but that they would typically not be able to do, such as add their account to the local Administrators group.

CCE Reference Number: CCE-37848-9

Compliance: Ensure 'Domain controller: LDAP server signing requirements' is set to 'Require signing' (DC only)

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Require signing:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Domain controller: LDAP server signing requirements>

Impact: Unless TLS\SSL is being used, the LDAP data signing option must be negotiated. Clients that do not support LDAP signing will be unable to run LDAP queries against the domain controllers. All

Windows 2000-based computers in your organization that are managed from Windows Server 2003-based or Windows XP-based computers and that use Windows NT Challenge/Response (NTLM) authentication must have Windows 2000 Service Pack 3 (SP3) installed. Alternatively, these clients must have a registry change. For information about this registry change, see Microsoft Knowledge Base article 325465: Windows 2000 domain controllers require SP3 or later when using Windows Server 2003 administration tools. Also, some non-Microsoft operating systems do not support LDAP signing. If you enable this policy setting, client computers that use those operating systems may be unable to access domain resources.

Vulnerability Details

This policy setting determines whether the Lightweight Directory Access Protocol (LDAP) server requires LDAP clients to negotiate data signing. Note: This policy setting does not have any impact on LDAP simple bind (ldap_simple_bind) or LDAP simple bind through SSL (ldap_simple_bind_s). No Microsoft LDAP clients that are shipped with Windows XP Professional use LDAP simple bind or LDAP simple bind through SSL to talk to a domain controller. The recommended state for this setting is: Require signing.

Rationale: Unsigned network traffic is susceptible to man-in-the-middle attacks. In such attacks, an intruder captures packets between the server and the client, modifies them, and then forwards them to the client. Where LDAP servers are concerned, an attacker could cause a client to make decisions that are based on false records from the LDAP directory. To lower the risk of such an intrusion in an organization's network, you can implement strong physical security measures to protect the network infrastructure. Also, you could implement Internet Protocol security (IPsec) authentication header mode (AH), which performs mutual authentication and packet integrity for IP traffic to make all types of man-in-the-middle attacks extremely difficult.

Compliance: Ensure 'Domain member: Digitally encrypt or sign secure channel data (always)' is set to 'Enabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Domain member: Digitally encrypt or sign secure channel data (always) Impact: Digital encryption and signing of the secure channel is a good idea where it is supported. The secure channel protects domain credentials as they are sent to the domain controller. However, only Windows NT 4.0 with Service Pack 6a (SP6a) and subsequent versions of the Windows operating system support digital encryption and signing of the secure channel. Windows 98 Second Edition clients do not support it unless they have the Dsclient installed. Therefore, you cannot enable the Domain member: Digitally encrypt or sign secure channel data (always) setting on domain controllers that support Windows 98 clients as members of the domain. Potential impacts can include the following:#x2022; The ability to create or delete trust relationships with clients running versions of Windows earlier than Windows NT 4.0 with SP6a will be disabled.#x2022; Logons from clients running versions of Windows earlier than Windows NT 4.0 with SP6a will be disabled.#x2022; The ability to authenticate other domains' users from a domain controller running a version of Windows earlier than Windows NT 4.0 with SP6a in a trusted domain will be disabled.You can enable this policy setting after you eliminate all Windows 9x clients from the domain and upgrade all Windows NT 4.0 servers and domain controllers from trusted/trusting domains to Windows NT 4.0 with SP6a. You can enable the other two policy settings, Domain member: Digitally encrypt secure channel data (when possible) and Domain member: Digitally encrypt sign channel data (when possible), on all computers in the domain that support them and clients running versions of Windows earlier than Windows NT 4.0 with SP6a and applications that run on these versions of Windows will not be affected.Digital encryption and signing of the secure channel is a good idea where it is supported. The secure channel protects domain credentials as they are sent to the domain controller. However, only Windows NT 4.0 with Service Pack 6a (SP6a) and subsequent versions of the Windows operating system support digital encryption and signing of the secure channel. Windows 98 Second Edition clients do not support it unless they have the Dsclient installed. Therefore, you cannot enable the Domain member: Digitally encrypt or sign secure channel data (always) setting on domain controllers that support Windows 98 clients as members of the domain. Potential impacts can include the following:#x2022; The ability to create or delete trust relationships with clients running versions of Windows earlier than Windows NT 4.0 with SP6a will be disabled.#x2022; Logons from clients running versions of Windows earlier than Windows NT 4.0 with SP6a will be disabled.#x2022; The ability to authenticate other domains' users from a domain controller running a version of Windows earlier than Windows NT 4.0 with SP6a in a trusted domain will be disabled. You can enable this policy setting after you eliminate all Windows 9x clients from the domain and upgrade all Windows NT 4.0 servers and domain controllers from trusted/trusting domains to Windows NT 4.0 with SP6a. You can enable the other two policy settings, Domain member: Digitally encrypt secure channel data (when possible) and Domain member: Digitally encrypt sign channel data (when possible), on all computers in the domain that support them and clients running versions of Windows earlier than Windows NT 4.0 with SP6a and applications that run on these versions of Windows will not be affected.

Vulnerability Details

This policy setting determines whether all secure channel traffic that is initiated by the domain member must be signed or encrypted. If a system is set to always encrypt or sign secure channel data, it cannot establish a secure channel with a domain controller that is not capable of signing or encrypting all secure channel traffic, because all secure channel data must be signed and encrypted.Microsoft recommends to configure the Domain member: Digitally encrypt or sign secure channel data (always) setting to Enabled. The recommended state for this setting is: Enabled.

Rationale: When a computer joins a domain, a computer account is created. After it joins the domain, the computer uses the password for that account to create a secure channel with the domain controller for its domain every time that it restarts. Requests that are sent on the secure channel are authenticated#x2014;and sensitive information such as passwords are encrypted#x2014;but the channel is not integrity-checked, and not all information is encrypted. If a computer is configured to always encrypt or sign secure channel data but the domain controller cannot sign or encrypt any portion of the secure channel data, the computer and domain controller cannot establish a secure channel. If the computer is configured to encrypt or sign secure channel data when possible, a secure channel can be established, but the level of encryption and signing is negotiated.

CCE Reference Number: CCE-36142-8

This policy setting determines whether a domain member should attempt to negotiate encryption for all secure channel traffic that it initiates. The recommended state for this setting is: Enabled.

Rationale: When a computer joins a domain, a computer account is created. After it joins the domain, the computer uses the password for that account to create a secure channel with the domain controller for its domain every time that it restarts. Requests that are sent on the secure channel are authenticated and sensitive information such as passwords are encrypted but the channel is not integrity-checked, and not all information is encrypted. Digital encryption and signing of the secure channel is a good idea where it is supported. The secure channel protects domain credentials as they are sent to the domain controller.

CCE Reference Number: CCE-37130-2
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.6.2

False Positive Notes

Compliance: Ensure 'Domain member: Digitally sign secure channel data (when possible)' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Domain member: Digitally sign secure channel data (when possible) Impact: Digital encryption and signing of the secure channel is a good idea where it is supported. The secure channel protects domain credentials as they are sent to the domain controller. However, only Windows NT 4.0 with Service Pack 6a (SP6a) and subsequent versions of the Windows operating system support digital encryption and signing of the secure channel. Windows 98 Second Edition clients do not support it unless they have the Dsclient installed. Therefore, you cannot enable the Domain member: Digitally encrypt or sign secure channel data (always) setting on domain controllers that support Windows 98 clients as members of the domain. Potential impacts can include the following:#x2022; The ability to create or delete trust relationships with clients running versions of Windows earlier than Windows NT 4.0 with SP6a will be disabled.#x2022; Logons from clients running versions of Windows earlier than Windows NT 4.0 with SP6a will be disabled.#x2022; The ability to authenticate other domains' users from a domain controller running a version of Windows earlier than Windows NT 4.0 with SP6a in a trusted domain will be disabled.You can enable this policy setting after you eliminate all Windows 9x clients from the domain and upgrade all Windows NT 4.0 servers and domain controllers from trusted/trusting domains to Windows NT 4.0 with SP6a. You can enable the other two policy settings, Domain member: Digitally encrypt secure channel data (when possible) and Domain member: Digitally encrypt sign channel data (when possible), on all computers in the domain that support them and clients running versions of Windows earlier than Windows NT 4.0 with SP6a and applications that run on these versions of Windows will not be affected.

Vulnerability Details

This policy setting determines whether a domain member should attempt to negotiate whether all secure channel traffic that it initiates must be digitally signed. Digital signatures protect the traffic from being modified by anyone who captures the data as it traverses the network.Microsoft recommends to configure the Domain member: Digitally sign secure channel data (when possible) setting to Enabled. The recommended state for this setting is: Enabled.

Rationale: When a computer joins a domain, a computer account is created. After it joins the domain, the computer uses the password for that account to create a secure channel with the domain controller for its domain every time that it restarts. Requests that are sent on the secure channel are authenticated#x2014;and sensitive information such as passwords are encrypted#x2014;but the channel is not integrity-checked, and not all information is encrypted. If a computer is configured to always encrypt or sign secure channel data but the domain controller cannot sign or encrypt any portion of the secure channel data, the computer and domain controller cannot establish a secure channel. If the computer is configured to encrypt or sign secure channel data when possible, a secure channel can be established, but the level of encryption and signing is negotiated.

Compliance: Ensure 'Domain member: Disable machine account password changes' is set to 'Disabled'	Trivial

Vulnerability Details

This policy setting determines whether a domain member can periodically change its computer account password. If you enable this policy setting, the domain member will be prevented from changing its computer account password. If you disable this policy setting, the domain member can change its computer account password as specified by the Domain Member: Maximum machine account password age setting, which by default is every 30 days. Computers that cannot automatically change their account passwords are potentially vulnerable, because an attacker might be able to determine the password for the system's domain account. The recommended state for this setting is: Disabled.

Rationale: The default configuration for Windows Server 2003 based computers that belong to a domain is that they are automatically required to change the passwords for their accounts every 30 days. If you disable this policy setting, computers that run Windows Server 2003 will retain the same passwords as their computer accounts. Computers that are no longer able to automatically change their account password are at risk from an attacker who could determine the password for the computer's domain account.

CCE Reference Number: CCE-37508-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.6.4

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Domain member: Disable machine account password changes Impact: None. This is the default configuration.

False Positive Notes

Compliance: Ensure 'Domain member: Maximum machine account password age' is set to '30 or fewer days, but not 0'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to 30 or fewer days, but not 0: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Domain member: Maximum machine account password age Impact: None. This is the default configuration.

Vulnerability Details

This policy setting determines the maximum allowable age for a computer account password. By default, domain members automatically change their domain passwords every 30 days. If you increase this interval significantly so that the computers no longer change their passwords, an attacker would have more time to undertake a brute force attack against one of the computer accounts. The recommended state for this setting is: 30 or fewer days, but not 0.

Note: A value of 0 does not conform to the benchmark as it disables maximum password age.

Rationale: In Active Directory-based domains, each computer has an account and password just like every user. By default, the domain members automatically change their domain password every 30 days. If you increase this interval significantly, or set it to 0 so that the computers no longer change their passwords, an attacker will have more time to undertake a brute force attack to guess the password of one or more computer accounts.

CCE Reference Number: CCE-37431-4
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.6.5

Compliance: Ensure 'Domain member: Require strong (Windows 2000 or later) session key' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Domain member: Require strong (Windows 2000 or later) session key Impact: Computers that have this policy setting enabled will not be able to join Windows NT 4.0 domains, and trusts between Active Directory domains and Windows NT-style domains may not work properly. Also, computers that do not support this policy setting will not be able to join domains in which the domain controllers have this policy setting enabled.

Vulnerability Details

When this policy setting is enabled, a secure channel can only be established with domain controllers that are capable of encrypting secure channel data with a strong (128-bit) session key. To enable this policy setting, all domain controllers in the domain must be able to encrypt secure channel data with a strong key, which means all domain controllers must be running Microsoft Windows 2000 or later. If communication to non-Windows 2000 based domains is required, it is recommended that you disable this policy setting. The recommended state for this setting is: Enabled.

Rationale: Session keys that are used to establish secure channel communications between domain controllers and member computers are much stronger in Windows 2000 than they were in previous Microsoft operating systems. Whenever possible, you should take advantage of these stronger session keys to help protect secure channel communications from attacks that attempt to hijack network sessions and eavesdropping. (Eavesdropping is a form of hacking in which network data is read or altered in transit. The data can be modified to hide or change the sender, or be redirected.)

CCE Reference Number: CCE-37614-5

Compliance: Ensure 'Do not allow COM port redirection' is set to 'Enabled'

Trivial

Vulnerability Details

This policy setting specifies whether to prevent the redirection of data to client COM ports from the remote computer in a Remote Desktop Services session. The recommended state for this setting is: Enabled.

Rationale: In a more security-sensitive environment, it is desirable to reduce the possible attack surface. The need for COM port redirection within a Remote Desktop session is very rare, so makes sense to reduce the number of unexpected avenues for data exfiltration and/or malicious code transfer.

CCE Reference Number: CCE-37696-2

Compliance: Ensure 'Do not allow drive redirection' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Device and Resource Redirection\Do not allow drive redirection Impact: Drive redirection will not be possible. In most cases, traditional network drive mapping to file shares (including administrative shares) will serve as a capable substitute to still allow file transfers when needed.

Vulnerability Details

This policy setting prevents users from sharing the local drives on their client computers to Terminal Servers that they access. Mapped drives appear in the session folder tree in Windows Explorer in the following format: \\TSClient\ <driveletter> $

If local drives are shared they are left vulnerable to intruders who want to exploit the data that is stored on them. The recommended state for this setting is: Enabled.

Rationale: Data could be forwarded from the user's Terminal Server session to the user's local computer without any direct user interaction.

CCE Reference Number: CCE-36509-8

Compliance: Ensure 'Do not allow password expiration time longer than required by policy' is set to 'Enabled' (MS only)	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\LAPS\Enable Local Admin Password Management Note: This Group Policy path does not exist by default. An additional Group Policy template (AdmPwd.admx/adml) is required - it is included with Microsoft Local Administrator Password Solution (LAPS). Impact: When you enable this setting, planned password expiration longer than password age dictated by "Password Settings" policy is NOT allowed.

Vulnerability Details

In May 2015, Microsoft released the Local Administrator Password Solution (LAPS) tool, which is free and supported software that allows an organization to automatically set randomized and unique local Administrator account passwords on domain-attached workstations and member servers. The passwords are stored in a confidential attribute of the domain computer account and can be retrieved from Active Directory by approved Sysadmins when needed. The LAPS tool requires a small Active Directory Schema update in order to implement, as well as installation of a Group Policy Client Side Extension (CSE) on targeted computers. Please see the LAPS documentation for details. LAPS supports Windows Vista or newer workstation OSes, and Server 2003 or newer server OSes. LAPS does not support standalone computers - they must be joined to a domain. The recommended state for this setting is: Enabled. Note: Organizations that utilize 3rd-party commercial software to manage unique & complex local Administrator passwords on domain members may opt to disregard these LAPS recommendations.

Rationale: Due to the difficulty in managing local Administrator passwords, many organizations choose to use the same password on all workstations and/or member servers when deploying them. This poses a serious attack surface security risk because if an attacker manages to compromise one system and learn the password to its local Administrator account, then they can leverage that account to instantly gain access to all other computers that also use that password for their local Administrator account. CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.2.2

Compliance: Ensure 'Do not delete temp folders upon exit' is set to 'Disabled'

Trivial

Vulnerability Details

This policy setting specifies whether Remote Desktop Services retains a user's per-session temporary folders at logoff. The recommended state for this setting is: Disabled .

Rationale: Sensitive information could be contained inside the temporary folders and shared with other administrators that log into the system.

CCE Reference Number: CCE-37946-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.48.3.11.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer

Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Do not delete temp folders upon exit Impact: If you disable this policy setting, temporary folders are deleted when a user logs off, even if the server administrator specifies otherwise.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Do not delete temp folders upon exit' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Temporary Folders\Do not delete temp folders upon exit>

Impact: None - this is the default configuration.

Vulnerability Details

This policy setting specifies whether Remote Desktop Services retains a user's per-session temporary folders at logoff. The recommended state for this setting is: Disabled.

Rationale: Sensitive information could be contained inside the temporary folders and shared with other administrators that log into the system.

Compliance: Ensure 'Do not enumerate connected users on domain-joined computers' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\System\Logon\Do not enumerate connected users on domain-joined computers Impact: The Logon UI will not enumerate any connected users on domain-joined computers.

Vulnerability Details

This policy setting prevents connected users from being enumerated on domain-joined computers. If you enable this policy setting, the Logon UI will not enumerate any connected users on domain-joined computers. If you disable or do not configure this policy setting, connected users will be enumerated on domain-joined computers. The recommended state for this setting is: Enabled.

Rationale: A malicious user could use this feature to gather account names of other users, that information could then be used in conjunction with other types of attacks such as guessing passwords or social engineering. The value of this countermeasure is small because a user with domain credentials could gather the same account information using other methods.

CCE Reference Number: CCE-37838-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.8.24.2

False Positive Notes

Compliance: Ensure 'Do not preserve zone information in file attachments' is set to 'Disabled'

Trivial

Vulnerability Details

This policy setting allows you to manage whether Windows marks file attachments from Internet Explorer or Microsoft Outlook' Express with information about their zone of origin (such as restricted, Internet, intranet, or local). This policy setting requires that files be downloaded to NTFS disk partitions to function correctly. If zone information is not preserved, Windows cannot make proper risk assessments based on the zone where the attachment came from. If the Do not preserve zone information in file attachments setting is enabled, file attachments are not marked with their zone information. If this policy setting is disabled, Windows is forced to store file attachments with their zone information. The recommended state for this setting is: Disabled.

Rationale: A file that is downloaded from a computer in the Internet or Restricted Sites zone may be moved to a location that makes it appear safe, like an intranet file share, and executed by an unsuspecting user.

CCE Reference Number: CCE-37424-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 19.7.4.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: User Configuration\Policies\Administrative Templates\Windows Components\Attachment Manager\Do not preserve zone information in file attachments Impact: None, this is the default configuration.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Do not use temporary folders per session' is set to 'Disabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Temporary Folders\Do not use temporary folders per session Impact: If this setting is enabled, only one temporary folder is used for all remote sessions. If a communal temporary folder is used, it might be possible for users to access other users temporary folders.

Vulnerability Details

By default, Remote Desktop Services creates a separate temporary folder on the RD Session Host server for each active session that a user maintains on the RD Session Host server. The temporary folder is created on the RD Session Host server in a Temp folder under the user's profile folder and is named with the "sessionid." This temporary folder is used to store individual temporary files. To reclaim disk space, the temporary folder is deleted when the user logs off from a session. The recommended state for this setting is: Disabled.

Rationale: By Disabling this setting you are keeping the cached data independent for each session, both reducing the chance of problems from shared cached data between sessions, and keeping possibly sensitive data separate to each user session.

CCE Reference Number: CCE-38180-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.48.3.11.2

There are no references for this vulnerability.	

Compliance: Ensure 'Enable/Disable PerfTrack' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\System\Troubleshooting and

Diagnostics\Windows Performance PerfTrack\Enable/Disable PerfTrack>

Impact: Responsiveness events are not processed.

Vulnerability Details

This policy setting specifies whether to enable or disable tracking of responsiveness events. The recommended state for this setting is: Disabled.

Rationale: When enabled the aggregated data of a given event will be transmitted to Microsoft. The option exists to restrict this feature for a specific user, set the consent level, and designate specific programs for which error reports could be sent. However, centrally restricting the ability to execute PerfTrack to limit the potential for unauthorized or undesired usage, data leakage, or unintentional communications is highly recommended.

CCE Reference Number: CCE-36648-4

Compliance: Ensure 'Enable Font Providers' is set to 'Disabled' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Network\Fonts\Enable Font Providers

Note: This Group Policy path does not exist by default. An updated Group Policy template (GroupPolicy.admx/adml) is required - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer). Impact: Windows will not connect to an online font provider and will only enumerate locally-installed fonts.

Vulnerability Details

This policy setting determines whether Windows is allowed to download fonts and font catalog data from an online font provider. The recommended state for this setting is: Disabled.

Rationale: In an enterprise environment the IT department should be managing the changes to the system configuration, to ensure all changes are tested and approved.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.4.5.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Enable Local Admin Password Management' is set to 'Enabled' (MS only) | Trivial

Vulnerability Details

In May 2015, Microsoft released the Local Administrator Password Solution (LAPS) tool, which is free and supported software that allows an organization to automatically set randomized and unique local Administrator account passwords on domain-attached workstations and member servers. The passwords are stored in a confidential attribute of the domain computer account and can be retrieved from Active Directory by approved Sysadmins when needed. The LAPS tool requires a small Active Directory Schema update in order to implement, as well as installation of a Group Policy Client Side Extension (CSE) on targeted computers. Please see the LAPS documentation for details. LAPS supports Windows Vista or newer workstation OSes, and Server 2003 or newer server OSes. LAPS does not support standalone computers - they must be joined to a domain. The recommended state for this setting is: Enabled. Note: Organizations that utilize 3rd-party commercial software to manage unique & complex local Administrator passwords on domain members may opt to disregard these LAPS recommendations.

Rationale: Due to the difficulty in managing local Administrator passwords, many organizations choose to use the same password on all workstations and/or member servers when deploying them. This poses a serious attack surface security risk because if an attacker manages to compromise one system and learn the password to its local Administrator account, then they can leverage that account to instantly gain access to all other computers that also use that password for their local Administrator account. CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.2.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\LAPS\Enable Local Admin Password Management Note: This Group Policy path does not exist by default. An additional Group Policy template (AdmPwd.admx/adml) is required - it is included with Microsoft Local Administrator Password Solution (LAPS). Impact: If you enable this setting, local administrator password is managed. If you disable or not configure this setting, local administrator password is NOT managed. In a disaster recovery scenario where Active Directory is not available, the local Administrator password will not be retrievable and a local password reset using a tool (such as Microsoft's Disaster and Recovery Toolset (DaRT) Recovery Image) may be necessary.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

Compliance: Ensure 'Enable RPC Endpoint Mapper Client Authentication' is set to 'Enabled' (MS only)	Trivial

Vulnerability Details

This policy setting controls whether RPC clients authenticate with the Endpoint Mapper Service when the call they are making contains authentication information. The Endpoint Mapper Service on computers running Windows NT4 (all service packs) cannot process authentication information supplied in this manner. This policy setting can cause a specific issue with 1-way forest trusts if it is applied to the trusting domain DCs (see Microsoft KB3073942), so we do not recommend applying it to domain controllers. If you disable this policy setting, RPC clients will not authenticate to the Endpoint Mapper Service, but they will be able to communicate with the Endpoint Mapper Service on Windows NT4 Server. If you enable this policy setting, RPC clients will authenticate to the Endpoint Mapper Service for calls that contain authentication information. Clients making such calls will not be able to communicate with the Windows NT4 Server Endpoint Mapper Service. If you do not configure this policy setting, it remains disabled. RPC clients will not authenticate to the Endpoint Mapper Service, but they will be able to communicate with the Windows NT4 Server Endpoint Mapper Service.

Note: This policy will not be applied until the system is rebooted. The recommended state for this setting is: Enabled.

Rationale: Anonymous access to RPC services could result in accidental disclosure of information to unauthenticated users.

CCE Reference Number: CCE-37346-4
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.8.31.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\System\Remote Procedure Call\Enable RPC Endpoint Mapper Client Authentication Impact: RPC clients will authenticate to the Endpoint Mapper Service for calls that contain authentication information. Clients making such calls will not be able to communicate with the Windows NT4 Server Endpoint Mapper Service.

False Positive Notes

Compliance: Ensure 'Enable screen saver' is set to 'Enabled' — Trivial

Vulnerability Details

This policy setting allows you to manage whether or not screen savers run. If the Screen Saver setting is disabled screen savers do not run and the screen saver section of the Screen Saver tab in Display in Control Panel is disabled. If this setting is enabled a screen saver will run if the following two conditions are met: first, that a valid screen saver is specified on the client via the Screen Saver Executable Name group policy setting or Control Panel on the client. Second, the screensaver timeout is set to a value greater than zero via the Screen Saver Timeout group policy setting or Control Panel on the client. The recommended state for this setting is: Enabled.

Rationale: If a user forgets to lock their computer when they walk away it's possible that a passerby will hijack it.

CCE Reference Number: CCE-37970-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 19.1.3.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: User Configuration\Policies\Administrative Templates\Control Panel\Personalization\Enable screen saver
Impact: The screen saver will automatically activate when the computer has been unattended for the amount of time specified by the Screen Saver timeout setting. The impact should be minimal since the screen saver is enabled by default.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Enable Windows NTP Client' is set to 'Enabled' — Trivial

Vulnerability Details

This policy setting specifies whether the Windows NTP Client is enabled. Enabling the Windows NTP Client allows your computer to synchronize its computer clock with other NTP servers. You might want to disable this service if you decide to use a third-party time provider. The recommended state for this setting is: Enabled.

Rationale: A reliable and accurate account of time is important for a number of services and security requirements, including but not limited to distributed applications, authentication services, multi-user databases and logging services. The use of an NTP client (with secure operation) establishes functional accuracy and is a focal point when reviewing security relevant events

CCE Reference Number: CCE-37843-0
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.44.1.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Windows Time Service\Time Providers\Enable Windows NTP Client>

Impact: You can set the local computer clock to synchronize time with NTP servers.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting allows you to specify whether the Windows NTP Server is enabled. The recommended state for this setting is: Disabled.

Rationale: The configuration of proper time synchronization is critically important in a corporate environment both due to the sensitivity of Kerberos authentication timestamps and also to ensure accurate security logging.

CCE Reference Number: CCE-37319-1
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.44.1.2

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\System\Windows Time Service\Time Providers\Enable Windows NTP Server>

Impact: None - this is the default configuration.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

Compliance: Ensure 'Enforce password history' is set to '24 or more password(s)' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to 24 or more password(s): Computer Configuration\Policies\Windows Settings\Security Settings\Account Policies\Password Policy\Enforce password history Impact: The major impact of this configuration is that users must create a new password every time they are required to change their old one. If users are required to change their passwords to new unique values, there is an increased risk of users who write their passwords somewhere so that they do not forget them. Another risk is that users may create passwords that change incrementally (for example, password01, password02, and so on) to facilitate memorization but make them easier to guess. Also, an excessively low value for the Minimum password age setting will likely increase administrative overhead, because users who forget their passwords might ask the help desk to reset them frequently.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting determines the number of renewed, unique passwords that have to be associated with a user account before you can reuse an old password. The value for this policy setting must be between 0 and 24 passwords. The default value for Windows Vista is 0 passwords, but the default setting in a domain is 24 passwords. To maintain the effectiveness of this policy setting, use the Minimum password age setting to prevent users from repeatedly changing their password. The recommended state for this setting is: 24 or more password(s).

Rationale: The longer a user uses the same password, the greater the chance that an attacker can determine the password through brute force attacks. Also, any accounts that may have been compromised will remain exploitable for as long as the password is left unchanged. If password changes are required but password reuse is not prevented, or if users continually reuse a small number of passwords, the effectiveness of a good password policy is greatly reduced. If you specify a low number for this policy setting, users will be able to use the same small number of passwords repeatedly. If you do not also configure the Minimum password age setting, users might repeatedly change their passwords until they can reuse their original password.

CCE Reference Number: CCE-37166-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 1.1.1

CVSS Base Score: 0

Compliance: Ensure 'Enumerate administrator accounts on elevation' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Credential User Interface\Enumerate administrator accounts on elevation Impact: If you enable this policy setting, all local administrator accounts on the machine will be displayed so the user can choose one and enter the correct password. If you disable this policy setting, users will be required to always type in a username and password to elevate.

Vulnerability Details

By default, all administrator accounts are displayed when you attempt to elevate a running application. The recommended state for this setting is: Disabled.

Rationale: Users could see the list of administrator accounts, making it slightly easier for a malicious user who has logged onto a console session to try to crack the passwords of those accounts.

CCE Reference Number: CCE-36512-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.13.2

False Positive Notes

Compliance: Ensure 'Enumerate local users on domain-joined computers' is set to 'Disabled'

Trivial

Vulnerability Details

This policy setting allows local users to be enumerated on domain-joined computers. If you enable this policy setting, Logon UI will enumerate all local users on domain-joined computers. If you disable or do not configure this policy setting, the Logon UI will not enumerate local users on domain-joined computers. The recommended state for this setting is: Disabled.

Rationale: A malicious user could use this feature to gather account names of other users, that information could then be used in conjunction with other types of attacks such as guessing passwords or social engineering. The value of this countermeasure is small because a user with domain credentials could gather the same account information using other methods.

CCE Reference Number: CCE-35894-5
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.8.24.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\System\Logon\Enumerate local users on domain-joined computers Impact: None - this is the default behavior.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Force shutdown from a remote system' is set to 'Administrators'	Trivial

Vulnerability Details

This policy setting allows users to shut down Windows Vista-based computers from remote locations on the network. Anyone who has been assigned this user right can cause a denial of service (DoS) condition, which would make the computer unavailable to service user requests. Therefore, it is recommended that only highly trusted administrators be assigned this user right. The recommended state for this setting is: Administrators.

Rationale: Any user who can shut down a computer could cause a DoS condition to occur. Therefore, this user right should be tightly restricted.

CCE Reference Number: CCE-37877-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.23

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Force shutdown from a remote system Impact: If you remove the Force shutdown from a remote system user right from the Server Operator group you could limit the abilities of users who are assigned to specific administrative roles in your environment. You should confirm that delegated activities will not be adversely affected.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Force specific screen saver: Screen saver executable name' is set to 'Enabled: scrnsave.scr'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: scrnsave.scr: User Configuration\Policies\Administrative Templates\Control Panel\Personalization\Force specific screen saver Impact: The screen saver will automatically activate when the computer has been unattended for the amount of time specified by the Screen Saver timeout setting.

Vulnerability Details

This policy setting allows you to manage whether or not screen savers run. If the Screen Saver setting is disabled screen savers do not run and the screen saver section of the Screen Saver tab in Display in Control Panel is disabled. If this setting is enabled a screen saver will run if the following two conditions are met: first, that a valid screen saver is specified on the client via the Screen Saver Executable Name group policy setting or Control Panel on the client. Second, the screensaver timeout is set to a value greater than zero via the Screen Saver Timeout group policy setting or Control Panel on the client. The recommended state for this setting is: Enabled: scrnsave.scr.

Rationale: If a user forgets to lock their computer when they walk away it's possible that a passerby will hijack it.

CCE Reference Number: CCE-37907-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 19.1.3.2

Compliance: Ensure 'Generate security audits' is set to 'LOCAL SERVICE, NETWORK SERVICE'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to LOCAL SERVICE, NETWORK SERVICE : Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Generate security audits Impact: On most computers, this is the default configuration and there will be no negative impact. However, if you have installed the Web Server (IIS) Role with Web Services Role Service, you will need to allow the IIS application pool(s) to be granted this User Right Assignment.

Vulnerability Details

This policy setting determines which users or processes can generate audit records in the Security log. The recommended state for this setting is: LOCAL SERVICE, NETWORK SERVICE.

Note: A server that holds the Web Server (IIS) Role with Web Server Role Service will require a special exception to this recommendation, to allow IIS application pool(s) to be granted this user right.

Note #2: A server that holds the Active Directory Federation Services Role will require a special exception to this recommendation, to allow the NT SERVICE\ADFSSrv and NT SERVICE\DRS services, as well as the associated Active Directory Federation Services service account, to be granted this user right.

Rationale: An attacker could use this capability to create a large number of audited events, which would make it more difficult for a system administrator to locate any illicit activity. Also, if the event log is configured to overwrite events as needed, any evidence of unauthorized activities could be overwritten by a large number of unrelated events.

CCE Reference Number: CCE-37639-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.24

Compliance: Ensure 'Hardened UNC Paths' is set to 'Enabled, with "Require Mutual Authentication" and "Require Integrity" set for all NETLOGON and SYSVOL shares'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled with the following paths configured, at a minimum: \\*\NETLOGON RequireMutualAuthentication=1, RequireIntegrity=1 \\*\SYSVOL RequireMutualAuthentication=1, RequireIntegrity=1 Computer Configuration\Policies\Administrative Templates\Network\Network Provider\Hardened UNC Paths Note: This Group Policy path does not exist by default. An additional Group Policy template (NetworkProvider.admx/adml) is required - it is included with KB3000483 or with the Microsoft Windows 10 Administrative Templates. Impact: If you enable this policy, Windows only allows access to the specified UNC paths after fulfilling additional security requirements.

Vulnerability Details

This policy setting configures secure access to UNC paths. The recommended state for this setting is: Enabled, with "Require Mutual Authentication" and "Require Integrity" set for all NETLOGON and SYSVOL shares. Note: If the environment exclusively contains Windows 8.0 / Server 2012 or higher systems, then the "Privacy" setting may (optionally) also be set to enable SMB encryption. However, using SMB encryption will render the targeted share paths completely inaccessible by older OSes, so only use this additional option with caution and thorough testing.

Rationale: In February 2015, Microsoft released a new control mechanism to mitigate a security risk in Group Policy as part of MS15-011 / MSKB 3000483. This mechanism requires both the installation of the new security update and also the deployment of specific group policy settings to all computers on the domain from Vista/Server 2008 or higher (the associated security patch to enable this feature was not released for Server 2003). A new group policy template (NetworkProvider.admx/adml) was also provided with the security update. Once the new GPO template is in place, the following are the minimum requirements to remediate the Group Policy security risk: \\*\NETLOGON RequireMutualAuthentication=1, RequireIntegrity=1\\*\SYSVOL RequireMutualAuthentication=1, RequireIntegrity=1 Note: A reboot may be required after the setting is applied to a client machine to access the above paths. Additional guidance on the deployment of this security setting is available from the Microsoft Premier Field Engineering (PFE) Platforms TechNet Blog here: Guidance on Deployment of MS15-011 and MS15-014. CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.4.13.1

Compliance: Ensure 'Interactive logon: Do not display last user name' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Interactive logon: Do not display last user name Impact: Users will not see their user name or domain name when unlocking their computer, they will have to enter that information.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting determines whether the account name of the last user to log on to the client computers in your organization will be displayed in each computer's respective Windows logon screen. Enable this policy setting to prevent intruders from collecting account names visually from the screens of desktop or laptop computers in your organization. The recommended state for this setting is: Enabled.

Rationale: An attacker with access to the console (for example, someone with physical access or someone who is able to connect to the server through Terminal Services) could view the name of the last user who logged on to the server. The attacker could then try to guess the password, use a dictionary, or use a brute-force attack to try and log on.

Compliance: Ensure 'Interactive logon: Do not require CTRL+ALT+DEL' is set to 'Disabled'

Trivial

Vulnerability Details

This policy setting determines whether users must press CTRL+ALT+DEL before they log on. If you enable this policy setting, users can log on without this key combination. If you disable this policy setting, users must press CTRL+ALT+DEL before they log on to Windows unless they use a smart card for Windows logon. A smart card is a tamper-proof device that stores security information. The recommended state for this setting is: Disabled.

Rationale: Microsoft developed this feature to make it easier for users with certain types of physical impairments to log on to computers that run Windows. If users are not required to press CTRL+ALT+DEL, they are susceptible to attacks that attempt to intercept their passwords. If CTRL+ALT+DEL is required before logon, user passwords are communicated by means of a trusted path. An attacker could install a Trojan horse program that looks like the standard Windows logon dialog box and capture the user's password. The attacker would then be able to log on to the compromised account with whatever level of privilege that user has.

CCE Reference Number: CCE-37637-6

Compliance: Ensure 'Interactive logon: Machine inactivity limit' is set to '900 or fewer second(s), but not 0' | Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to 900 or fewer seconds, but not 0: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Interactive logon: Machine inactivity limit Impact: The screen saver will automatically activate when the computer has been unattended for the amount of time specified. The impact should be minimal since the screen saver is enabled by default.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Windows notices inactivity of a logon session, and if the amount of inactive time exceeds the inactivity limit, then the screen saver will run, locking the session. The recommended state for this setting is: 900 or fewer second(s), but not 0.

Note: A value of 0 does not conform to the benchmark as it disables the machine inactivity limit.

Rationale: If a user forgets to lock their computer when they walk away it's possible that a passerby will hijack it.

CCE Reference Number: CCE-38235-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.7.3

Compliance: Ensure 'Interactive logon: Number of previous logons to cache (in case domain controller is not available)' is set to '4 or fewer logon(s)' (MS only)

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to 4 or fewer logon(s):

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Interactive logon: Number of previous logons to cache (in case domain controller is not available)>

Impact: Users will be unable to log on to any computers if there is no domain controller available to authenticate them. Organizations may want to configure this value to 2 for end-user computers, especially for mobile users. A configuration value of 2 means that the user's logon information will still be in the cache, even if a member of the IT department has recently logged on to their computer to perform system maintenance. This method allows users to log on to their computers when they are not connected to the organization's network.

Vulnerability Details

This policy setting determines whether a user can log on to a Windows domain using cached account information. Logon information for domain accounts can be cached locally to allow users to log on even if a domain controller cannot be contacted. This policy setting determines the number of unique users for whom logon information is cached locally. If this value is set to 0, the logon cache feature is disabled. An attacker who is able to access the file system of the server could locate this cached information and use a brute force attack to determine user passwords. The recommended state for this setting is: 4 or fewer logon(s).

Rationale: The number that is assigned to this policy setting indicates the number of users whose logon information the computer will cache locally. If the number is set to 4, then the computer caches logon information for 4 users. When a 5th user logs on to the computer, the server overwrites the oldest cached logon session. Users who access the computer console will have their logon credentials cached on that computer. An attacker who is able to access the file system of the computer could locate this cached information and use a brute force attack to attempt to determine user passwords. To mitigate this type of attack, Windows encrypts the information and obscures its physical location.

Compliance: Ensure 'Interactive logon: Prompt user to change password before expiration' is set to 'between 5 and 14 days' — Trivial

Vulnerability Details

This policy setting determines how far in advance users are warned that their password will expire. It is recommended that you configure this policy setting to at least 5 days but no more than 14 days to sufficiently warn users when their passwords will expire. The recommended state for this setting is: between 5 and 14 days .

Rationale: It is recommended that user passwords be configured to expire periodically. Users will need to be warned that their passwords are going to expire, or they may inadvertently be locked out of the computer when their passwords expire. This condition could lead to confusion for users who access the network locally, or make it impossible for users to access your organization's network through dial-up or virtual private network (VPN) connections.

CCE Reference Number: CCE-37622-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.7.7

Solution Details

To establish the recommended configuration via GP, set the following UI path to a value between 5 and 14 days: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Interactive logon: Prompt user to change password before expiration Impact: Users will see a dialog box prompt to change their password each time that they log on to the domain when their password is configured to expire between 5 and 14 days.

Compliance: Ensure 'Interactive logon: Require Domain Controller Authentication to unlock workstation' is set to 'Enabled' (MS only) — Trivial

Solution Details

To implement the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Interactive logon: Require Domain Controller Authentication to unlock workstation Impact: When the console on a computer is locked, either by a user or automatically by a screen saver time-out, the console can only be unlocked if the user is able to re-authenticate to the domain controller. If no domain controller is available, then users cannot unlock their workstations. If you configure the Interactive logon: Number of previous logons to cache (in case domain controller is not available) setting to 0, users whose domain controllers are unavailable (such as mobile or remote users) will not be able to log on.

Vulnerability Details

Logon information is required to unlock a locked computer. For domain accounts, the Interactive logon: Require Domain Controller authentication to unlock workstation setting determines whether it is necessary to contact a domain controller to unlock a computer. If you enable this setting, a domain controller must authenticate the domain account that is being used to unlock the computer. If you disable this setting, logon information confirmation with a domain controller is not required for a user to unlock the computer. However, if you configure the Interactive logon: Number of previous logons to cache (in case domain controller is not available) setting to a value that is greater than zero, then the user's cached credentials will be used to unlock the computer. The recommended state for this setting is: Enabled.

Rationale: By default, the computer caches in memory the credentials of any users who are authenticated locally. The computer uses these cached credentials to authenticate anyone who attempts to unlock the console. When cached credentials are used, any changes that have recently been made to the account#x2014;such as user rights assignments, account lockout, or the account being disabled#x2014;are not considered or applied after the account is authenticated. User privileges are not updated, and (more importantly) disabled accounts are still able to unlock the console of the computer.

CCE Reference Number: CCE-38240-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.7.8

Compliance: Ensure 'Interactive logon: Smart card removal behavior' is set to 'Lock Workstation' or higher

Trivial

Vulnerability Details

This policy setting determines what happens when the smart card for a logged-on user is removed from the smart card reader. The recommended state for this setting is: Lock Workstation. Configuring this setting to Force Logoff or Disconnect if a Remote Desktop Services session also conforms with the benchmark.

Rationale: Users sometimes forget to lock their workstations when they are away from them, allowing the possibility for malicious users to access their computers. If smart cards are used for authentication, the computer should automatically lock itself when the card is removed to ensure that only the user with the smart card is accessing resources using those credentials.

CCE Reference Number: CCE-38333-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.7.9

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Lock Workstation (or, if applicable for your environment, Force Logoff or Disconnect if a Remote Desktop Services session): Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Interactive logon: Smart card removal behavior Impact: If you select Force Logoff, users will have to re-insert their smart cards and re-enter their PINs when they return to their workstations. Enforcing this setting on computers used by people who must log onto multiple computers in order to perform their duties could be frustrating and lower productivity.

For example, if network administrators are limited to a single account but need to log into several computers simultaneously in order to effectively manage the network enforcing this setting will limit them to logging onto one computer at a time. For these reasons it is recommended that this setting only be enforced on workstations used for purposes commonly associated with typical users such as document creation and email.

CVSS Base Score: 0

Compliance: Ensure 'Interactive logon: Smart card removal behavior' is set to 'Lock Workstation' or higher	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Lock Workstation (or, if applicable for your environment, Force Logoff or Disconnect if a Remote Desktop Services session):

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Interactive logon: Smart card removal behavior>

Impact: If you select Lock Workstation, the workstation is locked when the smart card is removed, allowing users to leave the area, take their smart card with them, and still maintain a protected session. If you select Force Logoff, users are automatically logged off when their smart card is removed. If you select Disconnect if a Remote Desktop Services session, removal of the smart card disconnects the session without logging the users off. This allows the user to insert the smart card and resume the session later, or at another smart card reader-equipped computer, without having to log on again. If the session is local, this policy will function identically to Lock Workstation. Enforcing this setting on computers used by people who must log onto multiple computers in order to perform their duties could be frustrating and lower productivity.

For example, if network administrators are limited to a single account but need to log into several computers simultaneously in order to effectively manage the network enforcing this setting will limit them to logging onto one computer at a time. For these reasons it is recommended that this setting only be enforced on workstations used for purposes commonly associated with typical users such as document creation and email.

Vulnerability Details

Compliance: Ensure 'Join Microsoft MAPS' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Defender\MAPS\Join Microsoft MAPS>

Impact: None - this is the default configuration.

Vulnerability Details

This policy setting allows you to join Microsoft MAPS. Microsoft MAPS is the online community that helps you choose how to respond to potential threats. The community also helps stop the spread of new malicious software infections. You can choose to send basic or additional information about detected software. Additional information helps Microsoft create new definitions and help it to protect your computer. Possible options are: (0x0) Disabled (default) (0x1) Basic membership (0x2) Advanced membership Basic membership will send basic information to Microsoft about software that has been detected including where the software came from the actions that you apply or that are applied automatically and whether the actions were successful. Advanced membership in addition to basic information will send more information to Microsoft about malicious software spyware and potentially unwanted software including the location of the software file names how the software operates and how it has impacted your computer. The recommended state for this setting is: Disabled.

Rationale: This information can include things like location of detected items on your computer if harmful software was removed. The information will be automatically collected and sent. In some instances personal information might unintentionally be sent to Microsoft. However Microsoft will not use this information to identify you or contact you.

Compliance: Ensure LAPS AdmPwd GPO Extension / CSE is installed (MS only)	Trivial

Solution Details

In order to utilize LAPS, a minor Active Directory Schema update is required, and a Group Policy Client Side Extension (CSE) must be installed on each managed computer. When LAPS is installed, the file AdmPwd.dll must be present in the following location and registered in Windows (the LAPS AdmPwd GPO Extension / CSE installation does this for you): C:\Program Files\LAPS\CSE\AdmPwd.dll Impact: No impact. When installed and registered properly, AdmPwd.dll takes no action unless given appropriate GPO commands during Group Policy refresh. It is not a memory-resident agent or service. In a disaster recovery scenario where Active Directory is not available, the local Administrator password will not be retrievable and a local password reset using a tool (such as Microsoft's Disaster and Recovery Toolset (DaRT) Recovery Image) may be necessary.

Vulnerability Details

In May 2015, Microsoft released the Local Administrator Password Solution (LAPS) tool, which is free and supported software that allows an organization to automatically set randomized and unique local Administrator account passwords on domain-attached workstations and member servers. The passwords are stored in a confidential attribute of the domain computer account and can be retrieved from Active Directory by approved Sysadmins when needed. The LAPS tool requires a small Active Directory Schema update in order to implement, as well as installation of a Group Policy Client Side Extension (CSE) on targeted computers. Please see the LAPS documentation for details. LAPS supports Windows Vista or newer workstation OSes, and Server 2003 or newer server OSes. LAPS does not support standalone computers - they must be joined to a domain.

Note: Organizations that utilize 3rd-party commercial software to manage unique & complex local Administrator passwords on domain members may opt to disregard these LAPS recommendations.

Rationale: Due to the difficulty in managing local Administrator passwords, many organizations choose to use the same password on all workstations and/or member servers when deploying them. This poses a serious attack surface security risk because if an attacker manages to compromise one system and learn the password to its local Administrator account, then they can leverage that account to instantly gain access to all other computers that also use that password for their local Administrator account. CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.2.1

Compliance: Ensure 'Let Windows apps *' is set to 'Enabled: Force Deny'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI paths to Enabled: Force Deny: Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access account information Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access call history Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access contacts Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access email Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access location Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access messaging Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access motion Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access the calendar Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access the camera Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access the microphone Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access trusted devices Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps control radios Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps sync with devices Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps make phone calls Computer Configuration\Policies\Administrative Templates\Windows Components\App Privacy\Let Windows apps access notifications

Note: These Group Policy paths do not exist by default. An updated Group Policy template (AppPrivacy.admx/adml) is required to configure all of them - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer). Impact: Windows apps will be restricted from accessing potentially sensitive information or resources, and employees in your organization will not be able to change it.

Vulnerability Details

These policy settings specify whether Windows apps can access personal data, resources or other applications. The following 15 settings are in scope:
Let Windows apps access account information
Let Windows apps access call history Let Windows apps access contacts
Let Windows apps access email
Let Windows apps access location
Let Windows apps access messaging

Let Windows apps access motion
Let Windows apps access the calendar
Let Windows apps access the camera
Let Windows apps access the microphone
Let Windows apps access trusted devices
Let Windows apps control radios
Let Windows apps sync with devices
Let Windows apps make phone calls
Let Windows apps access notifications
The recommended state for these settings is: Enabled: Force Deny

Rationale: In an enterprise environment where you want to maintain user privacy, Windows apps should not need or require access to personal data, resources or other applications.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.5.1

Compliance: Ensure 'Load and unload device drivers' is set to 'Administrators'

Trivial

Vulnerability Details

This policy setting allows users to dynamically load a new device driver on a system. An attacker could potentially use this capability to install malicious code that appears to be a device driver. This user right is required for users to add local printers or printer drivers in Windows Vista. The recommended state for this setting is: Administrators.

Rationale: Device drivers run as highly privileged code. A user who has the Load and unload device drivers user right could unintentionally install malicious code that masquerades as a device driver. Administrators should exercise greater care and install only drivers with verified digital signatures.

CCE Reference Number: CCE-36318-4
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.27

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Load and unload device drivers Impact: If you remove the Load and unload device drivers user right from the Print Operators group or other accounts you could limit the abilities of users who are assigned to specific administrative roles in your environment. You should ensure that delegated tasks will not be negatively affected.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Load and unload device drivers' is set to 'Administrators' — Trivial

Vulnerability Details

This policy setting allows users to dynamically load a new device driver on a system. An attacker could potentially use this capability to install malicious code that appears to be a device driver. This user right is required for users to add local printers or printer drivers in Windows Vista. The recommended state for this setting is: Administrators.

Rationale: Device drivers run as highly privileged code. A user who has the Load and unload device drivers user right could unintentionally install malicious code that masquerades as a device driver. Administrators should exercise greater care and install only drivers with verified digital signatures.

CCE Reference Number: CCE-36318-4
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.27

False Positive Notes

Compliance: Ensure 'Lock pages in memory' is set to 'No One' — Trivial

Vulnerability Details

This policy setting allows a process to keep data in physical memory, which prevents the system from paging the data to virtual memory on disk. If this user right is assigned, significant degradation of system performance can occur. The recommended state for this setting is: No One.

Rationale: Users with the Lock pages in memory user right could assign physical memory to several processes, which could leave little or no RAM for other processes and result in a DoS condition.

CCE Reference Number: CCE-36495-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.28

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to No One: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Lock pages in memory Impact: None. This is the default configuration.

CVSS Base Score: 0

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Log on as a batch job' is set to 'Administrators' (DC Only)

Trivial

Vulnerability Details

This policy setting allows accounts to log on using the task scheduler service. Because the task scheduler is often used for administrative purposes, it may be needed in enterprise environments. However, its use should be restricted in high security environments to prevent misuse of system resources or to prevent attackers from using the right to launch malicious code after gaining user level access to a computer. When configuring a user right in the SCM enter a comma delimited list of accounts. Accounts can be either local or located in Active Directory, they can be groups, users, or computers. The recommended state for this setting is: Administrators.

Rationale: The Log on as a batch job user right presents a low-risk vulnerability. For most organizations, the default settings are sufficient.

CCE Reference Number: CCE-38080-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.29

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to Administrators:

<Computer Configuration\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Log on as a batch job>

Impact: If you configure the Log on as a batch job setting through domain-based Group Policies, the computer will not be able to assign the user right to accounts that are used for scheduled jobs in the

Task Scheduler. If you install optional components such as ASP.NET or IIS, you might need to assign this user right to additional accounts that are required by those components. For example, IIS requires assignment of this user right to the IIS_WPG group and the IUSR_(ComputerName), ASPNET, and IWAM_(ComputerName) accounts. If this user right is not assigned to this group and these accounts, IIS will be unable to run some COM objects that are necessary for proper functionality.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Maximum password age' is set to '60 or fewer days, but not 0'	Trivial

Vulnerability Details

This policy setting defines how long a user can use their password before it expires. Values for this policy setting range from 0 to 999 days. If you set the value to 0, the password will never expire. Because attackers can crack passwords, the more frequently you change the password the less opportunity an attacker has to use a cracked password. However, the lower this value is set, the higher the potential for an increase in calls to help desk support due to users having to change their password or forgetting which password is current. The recommended state for this setting is 60 or fewer days, but not 0.

Rationale: The longer a password exists the higher the likelihood that it will be compromised by a brute force attack, by an attacker gaining general knowledge about the user, or by the user sharing the password. Configuring the Maximum password age setting to 0 so that users are never required to change their passwords is a major security risk because that allows a compromised password to be used by the malicious user for as long as the valid user is authorized access.

CCE Reference Number: CCE-37167-4
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 1.1.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to 60 or fewer days, but not 0: Computer Configuration\Policies\Windows Settings\Security Settings\Account Policies\Password Policy\Maximum password age Impact: If the Maximum password age setting is too low, users are required to change their passwords very often. Such a configuration can reduce security in the organization, because users might write their passwords in an insecure location or lose them. If the value for this policy setting is too high, the level of security within an organization is reduced because it allows potential attackers more time in which to discover user passwords or to use compromised accounts.

CVSS Base Score: 0

Compliance: Ensure 'Microsoft network client: Digitally sign communications (always)' is set to 'Enabled'	Trivial

Vulnerability Details

This policy setting determines whether packet signing is required by the SMB client component. If you enable this policy setting, the Microsoft network client computer cannot communicate with a Microsoft network server unless that server agrees to sign SMB packets. In mixed environments with legacy client computers, set this option to Disabled because these computers will not be able to authenticate or gain access to domain controllers. However, you can use this policy setting in Windows 2000 or later environments.

Note: When Windows Vista-based computers have this policy setting enabled and they connect to file or print shares on remote servers, it is important that the setting is synchronized with its companion setting, Microsoft network server: Digitally sign communications (always), on those servers. For more information about these settings, see the "Microsoft network client and server: Digitally sign communications (four related settings)" section in Chapter 5 of the Threats and Countermeasures guide. The recommended state for this setting is: Enabled.

Rationale: Session hijacking uses tools that allow attackers who have access to the same network as the client or server to interrupt, end, or steal a session in progress. Attackers can potentially intercept and modify unsigned SMB packets and then modify the traffic and forward it so that the server might perform undesirable actions. Alternatively, the attacker could pose as the server or client after legitimate authentication and gain unauthorized access to data. SMB is the resource sharing protocol that is supported by many Windows operating systems. It is the basis of NetBIOS and many other protocols. SMB signatures authenticate both users and the servers that host the data. If either side fails the authentication process, data transmission will not take place.

CCE Reference Number: CCE-36325-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.8.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Microsoft network client: Digitally sign communications (always) Impact: The Windows 2000 Server, Windows 2000 Professional, Windows Server 2003, Windows XP Professional and Windows Vista implementations of the SMB file and print sharing protocol support mutual authentication, which prevents session hijacking attacks and supports message authentication to prevent man-in-the-middle attacks. SMB signing provides this authentication by placing a digital signature into each SMB, which is then verified by both the client and the server. Implementation of SMB signing may negatively affect performance, because each packet needs to be signed and verified. If these settings are enabled on a server that is performing multiple roles, such as a small business server that is serving as a domain controller, file server, print server, and application server performance may be substantially slowed. Additionally, if you configure computers to ignore all unsigned SMB communications, older applications and operating systems will not be able to connect. However, if you completely disable all SMB signing, computers will be vulnerable to session hijacking attacks. When SMB signing policies are enabled on domain controllers running Windows Server 2003 and member computers running Windows Vista SP1 or Windows Server 2008 group policy processing will fail. A hotfix is available from Microsoft that resolves this issue; see Microsoft Knowledge Base article 950876 for more details: Group Policy settings are not applied on member computers that are running Windows Server 2008 or Windows Vista SP1 when certain SMB signing policies are enabled.

False Positive Notes

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting determines whether the SMB client will attempt to negotiate SMB packet signing. The implementation of digital signing in Windows-based networks helps to prevent sessions from being hijacked. If you enable this policy setting, the Microsoft network client will use signing only if the server with which it communicates accepts digitally signed communication. Note: Enabling this policy setting on SMB clients on your network makes them fully effective for packet signing with all clients and servers in your environment. The recommended state for this setting is: Enabled.

Rationale: Session hijacking uses tools that allow attackers who have access to the same network as the client or server to interrupt, end, or steal a session in progress. Attackers can potentially intercept and modify unsigned SMB packets and then modify the traffic and forward it so that the server might perform undesirable actions. Alternatively, the attacker could pose as the server or client after legitimate authentication and gain unauthorized access to data. SMB is the resource sharing protocol that is supported by many Windows operating systems. It is the basis of NetBIOS and many other protocols. SMB signatures authenticate both users and the servers that host the data. If either side fails the authentication process, data transmission will not take place.

Compliance: Ensure 'Microsoft network client: Send unencrypted password to third-party SMB servers' is set to 'Disabled'

Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Microsoft network client: Send unencrypted password to third-party SMB servers Impact: Some very old applications and operating systems such as MS-DOS, Windows for Workgroups 3.11, and Windows 95a may not be able to communicate with the servers in your organization by means of the SMB protocol.

Vulnerability Details

Disable this policy setting to prevent the SMB redirector from sending plaintext passwords during authentication to third-party SMB servers that do not support password encryption. It is recommended that you disable this policy setting unless there is a strong business case to enable it. If this policy setting is enabled, unencrypted passwords will be allowed across the network. The recommended state for this setting is: Disabled.

Rationale: If you enable this policy setting, the server can transmit passwords in plaintext across the network to other computers that offer SMB services. These other computers may not use any of the SMB security mechanisms that are included with Windows Server 2003.

CCE Reference Number: CCE-37863-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.8.3

Compliance: Ensure 'Microsoft network server: Amount of idle time required before suspending session' is set to '15 or fewer minute(s), but not 0'	Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to 15 or fewer minute(s), but not 0: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Microsoft network server: Amount of idle time required before suspending session Impact: There will be little impact because SMB sessions will be re-established automatically if the client resumes activity.

Vulnerability Details

This policy setting allows you to specify the amount of continuous idle time that must pass in an SMB session before the session is suspended because of inactivity. Administrators can use this policy setting to control when a computer suspends an inactive SMB session. If client activity resumes, the session is automatically reestablished. A value of 0 appears to allow sessions to persist indefinitely. The maximum value is 99999, which is over 69 days; in effect, this value disables the setting. The recommended state for this setting is: 15 or fewer minute(s), but not 0.

Rationale: Each SMB session consumes server resources, and numerous null sessions will slow the server or possibly cause it to fail. An attacker could repeatedly establish SMB sessions until the server's SMB services become slow or unresponsive.

A hotfix is available from Microsoft that resolves this issue; see Microsoft Knowledge Base article 950876 for more details: Group Policy settings are not applied on member computers that are running Windows Server 2008 or Windows Vista SP1 when certain SMB signing policies are enabled.

Vulnerability Details

This policy setting determines if the server side SMB service is required to perform SMB packet signing. Enable this policy setting in a mixed environment to prevent downstream clients from using the workstation as a network server. The recommended state for this setting is: Enabled.

Rationale: Session hijacking uses tools that allow attackers who have access to the same network as the client or server to interrupt, end, or steal a session in progress. Attackers can potentially intercept and modify unsigned SMB packets and then modify the traffic and forward it so that the server might perform undesirable actions. Alternatively, the attacker could pose as the server or client after legitimate authentication and gain unauthorized access to data. SMB is the resource sharing protocol that is supported by many Windows operating systems. It is the basis of NetBIOS and many other protocols. SMB signatures authenticate both users and the servers that host the data. If either side fails the authentication process, data transmission will not take place.

CCE Reference Number: CCE-37864-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.9.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting determines whether packet signing is required by the SMB server component. Enable this policy setting in a mixed environment to prevent downstream clients from using the workstation as a network server. The recommended state for this setting is: Enabled.

Rationale: Session hijacking uses tools that allow attackers who have access to the same network as the client or server to interrupt, end, or steal a session in progress. Attackers can potentially intercept and modify unsigned SMB packets and then modify the traffic and forward it so that the server might perform undesirable actions. Alternatively, the attacker could pose as the server or client after legitimate authentication and gain unauthorized access to data. SMB is the resource sharing protocol that is supported by many Windows operating systems. It is the basis of NetBIOS and many other protocols. SMB signatures authenticate both users and the servers that host the data. If either side fails the authentication process, data transmission will not take place.

CCE Reference Number: CCE-37864-6
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.9.2

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Microsoft network server: Digitally sign communications (always)>

Impact: The Microsoft network server will not communicate with a Microsoft network client unless that client agrees to perform SMB packet signing. The Windows 2000 Server, Windows 2000 Professional, Windows Server 2003, Windows XP Professional and Windows Vista implementations of the SMB file and print sharing protocol support mutual authentication, which prevents session hijacking attacks and supports message authentication to prevent man-in-the-middle attacks. SMB signing provides this authentication by placing a digital signature into each SMB, which is then verified by both the client and the server. Implementation of SMB signing may negatively affect performance, because each packet needs to be signed and verified. If these settings are enabled on a server that is performing multiple roles, such as a small business server that is serving as a domain controller, file server, print server, and application server performance may be substantially slowed. Additionally, if you configure computers to ignore all unsigned SMB communications, older applications and operating systems will not be able to connect. However, if you completely disable all SMB signing, computers will be vulnerable to session hijacking attacks. When SMB signing policies are enabled on domain controllers running Windows Server 2003 and member computers running Windows Vista SP1 or Windows Server 2008 group policy processing will fail. A hotfix is available from Microsoft that resolves this issue; see Microsoft Knowledge Base article 950876 for more details: Group Policy settings are not applied on member computers that are running Windows Server 2008 or Windows Vista SP1 when certain SMB signing policies are enabled.

False Positive Notes

Compliance: Ensure 'Microsoft network server: Digitally sign communications (if client agrees)' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Microsoft network server: Digitally sign communications (if client agrees) Impact: The Windows 2000 Server, Windows 2000 Professional, Windows Server 2003, Windows XP Professional and Windows Vista implementations of the SMB file and print sharing protocol support mutual authentication, which prevents session hijacking attacks and supports message authentication to prevent man-in-the-middle attacks. SMB signing provides this authentication by placing a digital signature into each SMB, which is then verified by both the client and the server. Implementation of SMB signing may negatively affect performance, because each packet needs to be signed and verified. If these settings are enabled on a server that is performing multiple roles, such as a small business server that is serving as a domain controller, file server, print server, and application server performance may be substantially slowed. Additionally, if you configure computers to ignore all unsigned SMB communications, older applications and operating systems will not be able to connect. However, if you completely disable all SMB signing, computers will be vulnerable to session hijacking attacks. When SMB signing policies are enabled on domain controllers running Windows Server 2003 and member computers running Windows Vista SP1 or Windows Server 2008 group policy processing will fail. A hotfix is available from Microsoft that resolves this issue; see Microsoft Knowledge Base article 950876 for more details: Group Policy settings are not applied on member computers that are running Windows Server 2008 or Windows Vista SP1 when certain SMB signing policies are enabled.

Vulnerability Details

This policy setting determines if the server side SMB service is able to sign SMB packets if it is requested to do so by a client that attempts to establish a connection. If no signing request comes from the client, a connection will be allowed without a signature if the Microsoft network server: Digitally sign communications (always) setting is not enabled.

Note: Enable this policy setting on SMB clients on your network to make them fully effective for packet signing with all clients and servers in your environment. The recommended state for this setting is: Enabled.

Rationale: Session hijacking uses tools that allow attackers who have access to the same network as the client or server to interrupt, end, or steal a session in progress. Attackers can potentially intercept and modify unsigned SMB packets and then modify the traffic and forward it so that the server might perform undesirable actions. Alternatively, the attacker could pose as the server or client after legitimate authentication and gain unauthorized access to data. SMB is the resource sharing protocol that is supported by many Windows operating systems. It is the basis of NetBIOS and many other protocols. SMB signatures authenticate both users and the servers that host the data. If either side fails the authentication process, data transmission will not take place.

Compliance: Ensure 'Microsoft network server: Digitally sign communications (if client agrees)' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Microsoft network server: Digitally sign communications (if client agrees)>

Impact: The Microsoft network server will negotiate SMB packet signing as requested by the client. That is, if packet signing has been enabled on the client, packet signing will be negotiated. The Windows 2000 Server, Windows 2000 Professional, Windows Server 2003, Windows XP Professional and Windows Vista implementations of the SMB file and print sharing protocol support mutual authentication, which prevents session hijacking attacks and supports message authentication to prevent man-in-the-middle attacks. SMB signing provides this authentication by placing a digital signature into each SMB, which is then verified by both the client and the server. Implementation of SMB signing may negatively affect performance, because each packet needs to be signed and verified. If these settings are enabled on a server that is performing multiple roles, such as a small business server that is serving as a domain controller, file server, print server, and application server performance may be substantially slowed. Additionally, if you configure computers to ignore all unsigned SMB communications, older applications and operating systems will not be able to connect. However, if you completely disable all SMB signing, computers will be vulnerable to session hijacking attacks. When SMB signing policies are enabled on domain controllers running Windows Server 2003 and member computers running Windows Vista SP1 or Windows Server 2008 group policy processing will fail. A hotfix is available from Microsoft that resolves this issue; see Microsoft Knowledge Base article 950876 for more details: Group Policy settings are not applied on member computers that are running Windows Server 2008 or Windows Vista SP1 when certain SMB signing policies are enabled.

Vulnerability Details

This policy setting determines whether the SMB server will negotiate SMB packet signing with clients that request it. If no signing request comes from the client, a connection will be allowed without a signature if the Microsoft network server: Digitally sign communications (always) setting is not enabled.

Note: Enable this policy setting on SMB clients on your network to make them fully effective for packet signing with all clients and servers in your environment. The recommended state for this setting is: Enabled.

Rationale: Session hijacking uses tools that allow attackers who have access to the same network as the client or server to interrupt, end, or steal a session in progress. Attackers can potentially intercept and modify unsigned SMB packets and then modify the traffic and forward it so that the server might perform undesirable actions. Compliance: Ensure 'Microsoft network server: Disconnect clients when logon hours expire' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Microsoft network server: Disconnect clients when logon hours expire Impact: If logon hours are not used in your organization, this policy setting will have no impact. If logon hours are used, existing user sessions will be forcibly terminated when their logon hours expire.

Vulnerability Details

This policy setting determines whether to disconnect users who are connected to the local computer outside their user account's valid logon hours. It affects the SMB component. If you enable this policy setting, client sessions with the SMB service will be forcibly disconnected when the client's logon hours expire. If you disable this policy setting, established client sessions will be maintained after the client's logon hours expire. If you enable this policy setting you should also enable Network security: Force logoff when logon hours expire. If your organization configures logon hours for users, this policy setting is necessary to ensure they are effective. The recommended state for this setting is: Enabled.

Rationale: If your organization configures logon hours for users, then it makes sense to enable this policy setting. Otherwise, users who should not have access to network resources outside of their logon hours may actually be able to continue to use those resources with sessions that were established during allowed hours.

CCE Reference Number: CCE-37972-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.9.4

Compliance: Ensure 'Microsoft network server: Server SPN target name validation level' is set to 'Accept if provided by client' or higher

Trivial

Vulnerability Details

This policy setting controls the level of validation a computer with shared folders or printers (the server) performs on the service principal name (SPN) that is provided by the client computer when it establishes a session using the server message block (SMB) protocol. The server message block (SMB) protocol provides the basis for file and print sharing and other networking operations, such as remote Windows administration. The SMB protocol supports validating the SMB server service principal name (SPN) within the authentication blob provided by a SMB client to prevent a class of attacks against SMB servers referred to as SMB relay attacks. This setting will affect both SMB1 and SMB2. This security setting determines the level of validation a SMB server performs on the service principal name (SPN) provided by the SMB client when trying to establish a session to an SMB server. The recommended state for this setting is: Accept if provided by client. Configuring this setting to Required from client also conforms with the benchmark.

Rationale: The identity of a computer can be spoofed to gain unauthorized access to network resources.

CCE Reference Number: CCE-36170-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.9.5

Solution Details

To establish the recommended configuration via GP, set the following UI path to Accept if provided by client (configuring to Required from client also conforms with the benchmark): Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Microsoft network server: Server SPN target name validation level Impact: All Windows operating systems support both a client-side SMB component and a server-side SMB component. This setting affects the server SMB behavior, and its implementation should be carefully evaluated and tested to prevent disruptions to file and print serving capabilities.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Microsoft network server: Server SPN target name validation level' is set to 'Accept if provided by client' or higher (MS only)

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Accept if provided by client (configuring to Required from client also conforms to the benchmark):

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Microsoft network server: Server SPN target name validation level>

Impact: All Windows operating systems support both a client-side SMB component and a server-side

SMB component. This setting affects the server SMB behavior, and its implementation should be carefully evaluated and tested to prevent disruptions to file and print serving capabilities. If configured to Accept if provided by client, the SMB server will accept and validate the SPN provided by the SMB client and allow a session to be established if it matches the SMB servers list of SPNs for itself. If the SPN does NOT match, the session request for that SMB client will be denied. If configured to Required from client, the SMB client MUST send a SPN name in session setup, and the SPN name provided MUST match the SMB server that is being requested to establish a connection. If no SPN is provided by client, or the SPN provided does not match, the session is denied.

Note: Since the release of the MS KB3161561 security patch, this setting can cause significant issues (such as replication problems, group policy editing issues and blue screen crashes) on domain controllers when used simultaneously with UNC path hardening (i.e. rule 18.4.14.1). CIS therefore recommends against deploying this setting on domain controllers.

False Positive Notes

Compliance: Ensure 'Minimize the number of simultaneous connections to the Internet or a Windows Domain' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Network\Windows Connection Manager\Minimize the number of simultaneous connections to the Internet or a Windows Domain Impact: If this policy setting is enabled, when the computer has at least one active connection to the Internet, a new automatic connection attempt to the Internet is blocked. When the computer has at least one active connection to a Windows domain, a new automatic connection to the same Windows domain is also blocked. Additional manual connection attempts by users to the Internet or to a Windows domain are not blocked by this policy setting.

Vulnerability Details

This policy setting prevents computers from establishing multiple simultaneous connections to either the Internet or to a Windows domain. The recommended state for this setting is: Enabled.

Rationale: Blocking simultaneous connections can help prevent a user unknowingly allowing network traffic to flow between the Internet and the corporate network.

CCE Reference Number: CCE-38338-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.4.20.1

Compliance: Ensure 'Minimum password age' is set to '1 or more day(s)'	Trivial

Vulnerability Details

This policy setting determines the number of days that you must use a password before you can change it. The range of values for this policy setting is between 1 and 999 days. (You may also set the value to 0 to allow immediate password changes.) The default value for this setting is 0 days. The recommended state for this setting is: 1 or more day(s).

Rationale: Users may have favorite passwords that they like to use because they are easy to remember and they believe that their password choice is secure from compromise. Unfortunately, passwords are compromised and if an attacker is targeting a specific individual user account, with foreknowledge of data about that user, reuse of old passwords can cause a security breach. To address password reuse a combination of security settings is required. Using this policy setting with the Enforce password history setting prevents the easy reuse of old passwords. For example, if you configure the Enforce password history setting to ensure that users cannot reuse any of their last 12 passwords, they could change their password 13 times in a few minutes and reuse the password they started with, unless you also configure the Minimum password age setting to a number that is greater than 0. You must configure this policy setting to a number that is greater than 0 for the Enforce password history setting to be effective.

CCE Reference Number: CCE-37073-4
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 1.1.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to 1 or more day(s): Computer Configuration\Policies\Windows Settings\Security Settings\Account Policies\Password Policy\Minimum password age Impact: If an administrator sets a password for a user but wants that user to change the password when the user first logs on, the administrator must select the User must change password at next logon check box, or the user will not be able to change the password until the next day.

False Positive Notes

Compliance: Ensure 'Minimum password length' is set to '14 or more character(s)' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to 14 or more character(s): Computer Configuration\Policies\Windows Settings\Security Settings\Account Policies\Password Policy\Minimum password length Impact: Requirements for extremely long passwords can actually decrease the security of an organization, because users might leave the information in an insecure location or lose it. If very long passwords are required, mistyped passwords could cause account lockouts and increase the volume of help desk calls. If your organization has issues with forgotten passwords due to password length requirements, consider teaching your users about pass phrases, which are often easier to remember and, due to the larger number of character combinations, much harder to discover.

Note: Older versions of Windows such as Windows 98 and Windows NT 4.0 do not support passwords that are longer than 14 characters. Computers that run these older operating systems are unable to authenticate with computers or domains that use accounts that require long passwords.

Vulnerability Details

This policy setting determines the least number of characters that make up a password for a user account. There are many different theories about how to determine the best password length for an organization, but perhaps "pass phrase" is a better term than "password." In Microsoft Windows 2000 or later, pass phrases can be quite long and can include spaces. Therefore, a phrase such as "I want to drink a $5 milkshake" is a valid pass phrase; it is a considerably stronger password than an 8 or 10 character string of random numbers and letters, and yet is easier to remember. Users must be educated about the proper selection and maintenance of passwords, especially with regard to password length.In enterprise environments, the ideal value for the Minimum password length setting is 14 characters, however you should adjust this value to meet your organization's business requirements. The recommended state for this setting is: 14 or more character(s).

Rationale: Types of password attacks include dictionary attacks (which attempt to use common words and phrases) and brute force attacks (which try every possible combination of characters). Also, attackers sometimes try to obtain the account database so they can use tools to discover the accounts and passwords.

CCE Reference Number: CCE-36534-6

Compliance: Ensure 'Modify an object label' is set to 'No One' — Trivial

Vulnerability Details

This privilege determines which user accounts can modify the integrity label of objects, such as files, registry keys, or processes owned by other users. Processes running under a user account can modify the label of an object owned by that user to a lower level without this privilege. The recommended state for this setting is: No One.

Rationale: By modifying the integrity label of an object owned by another user a malicious user may cause them to execute code at a higher level of privilege than intended.

CCE Reference Number: CCE-36054-5
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.31

Solution Details

To establish the recommended configuration via GP, set the following UI path to No One: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Modify an object label Impact: None, by default the Administrators group has this user right.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Modify firmware environment values' is set to 'Administrators'

Trivial

Vulnerability Details

This policy setting allows users to configure the system-wide environment variables that affect hardware configuration. This information is typically stored in the Last Known Good Configuration. Modification of these values and could lead to a hardware failure that would result in a denial of service condition. The recommended state for this setting is: Administrators.

Rationale: Anyone who is assigned the Modify firmware environment values user right could configure the settings of a hardware component to cause it to fail, which could lead to data corruption or a DoS condition.

CCE Reference Number: CCE-38113-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.32

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Modify firmware environment values Impact: None. This is the default configuration.

False Positive Notes

Compliance: Ensure 'MSS: (AutoAdminLogon) Enable Automatic Logon (not recommended)' is set to 'Disabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (AutoAdminLogon) Enable Automatic Logon (not recommended)

Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM).
Impact: None. By default this entry is not enabled.

Vulnerability Details

This setting is separate from the Welcome screen feature in Windows XP and Windows Vista; if that feature is disabled, this setting is not disabled. If you configure a computer for automatic logon, anyone who can physically gain access to the computer can also gain access to everything that is on the computer, including any network or networks to which the computer is connected. Also, if you enable automatic logon, the password is stored in the registry in plaintext, and the specific registry key that stores this value is remotely readable by the Authenticated Users group. For additional information, see Microsoft Knowledge Base article 324737: How to turn on automatic logon in Windows. The recommended state for this setting is: Disabled.

Rationale: If you configure a computer for automatic logon, anyone who can physically gain access to the computer can also gain access to everything that is on the computer, including any network or networks that the computer is connected to. Also, if you enable automatic logon, the password is stored in the registry in plaintext. The specific registry key that stores this setting is remotely readable by the Authenticated Users group. As a result, this entry is appropriate only if the computer is physically secured and if you ensure that untrusted users cannot remotely see the registry.

CCE Reference Number: CCE-37067-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.3.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'MSS: (DisableIPSourceRouting) IP source routing protection level (protects against packet spoofing)' is set to 'Enabled: Highest protection, source routing is completely disa...

Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Highest protection, source routing is completely disabled: Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (DisableIPSourceRouting) IP source routing protection level (protects against packet spoofing)

Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM).

Impact: All incoming source routed packets will be dropped.

Vulnerability Details

IP source routing is a mechanism that allows the sender to determine the IP route that a datagram should take through the network. It is recommended to configure this setting to Not Defined for enterprise environments and to Highest Protection for high security environments to completely disable source routing. The recommended state for this setting is: Enabled: Highest protection, source routing is completely disabled.

Rationale: An attacker could use source routed packets to obscure their identity and location. Source routing allows a computer that sends a packet to specify the route that the packet takes.

CCE Reference Number: CCE-36535-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.3.3

Compliance: Ensure 'MSS: (EnableICMPRedirect) Allow ICMP redirects to override OSPF generated routes' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled : Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (EnableICMPRedirect) Allow ICMP redirects to override OSPF generated routes

Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM).

Impact: When Routing and Remote Access Service (RRAS) is configured as an autonomous system boundary router (ASBR), it does not correctly import connected interface subnet routes. Instead, this router injects host routes into the OSPF routes. However, the OSPF router cannot be used as an ASBR router, and when connected interface subnet routes are imported into OSPF the result is confusing routing tables with strange routing paths.

Vulnerability Details

Internet Control Message Protocol (ICMP) redirects cause the IPv4 stack to plumb host routes. These routes override the Open Shortest Path First (OSPF) generated routes. The recommended state for this setting is: Disabled.

Rationale: This behavior is expected. The problem is that the 10 minute time-out period for the ICMP redirect-plumbed routes temporarily creates a network situation in which traffic will no longer be routed properly for the affected host. Ignoring such ICMP redirects will limit the system's exposure to attacks that will impact its ability to participate on the network.

CCE Reference Number: CCE-37988-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.3.4

Type	Reference

Compliance: Ensure 'MSS: (KeepAliveTime) How often keep-alive packets are sent in milliseconds' is set to 'Enabled: 300,000 or 5 minutes (recommended)'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: 300,000 or 5 minutes (recommended):

<Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (KeepAliveTime) How often keep-alive packets are sent in milliseconds

Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM), or available from this TechNet blog post: https://blogs.technet.microsoft.com/secguide/2016/10/02/the-mss-settings/>

Impact: Keep-alive packets are not sent by default by Windows. However, some applications may configure the TCP stack flag that requests keep-alive packets. For such configurations, you can lower this value from the default setting of two hours to five minutes to disconnect inactive sessions more quickly.

Vulnerability Details

This value controls how often TCP attempts to verify that an idle connection is still intact by sending a keep-alive packet. If the remote computer is still reachable, it acknowledges the keep-alive packet. The recommended state for this setting is: Enabled: 300,000 or 5 minutes (recommended).

Rationale: An attacker who is able to connect to network applications could establish numerous connections to cause a DoS condition.

CCE Reference Number: CCE-36868-8

Compliance: Ensure 'MSS: (NoNameReleaseOnDemand) Allow the computer to ignore NetBIOS name release requests except from WINS servers' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (NoNameReleaseOnDemand) Allow the computer to ignore NetBIOS name release requests except from WINS servers Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM). Impact: An attacker could send a request over the network and query a computer to release its NetBIOS name. As with any change that could affect applications, it is recommended that you test this change in a non-production environment before you change the production environment.

Vulnerability Details

NetBIOS over TCP/IP is a network protocol that among other things provides a way to easily resolve NetBIOS names that are registered on Windows-based systems to the IP addresses that are configured on those systems. This setting determines whether the computer releases its NetBIOS name when it receives a name-release request. The recommended state for this setting is: Enabled.

Rationale: The NetBT protocol is designed not to use authentication, and is therefore vulnerable to spoofing. Spoofing makes a transmission appear to come from a user other than the user who performed the action. A malicious user could exploit the unauthenticated nature of the protocol to send a name-conflict datagram to a target computer, which would cause the computer to relinquish its name and not respond to queries. The result of such an attack could be to cause intermittent connectivity issues on the target computer, or even to prevent the use of Network Neighborhood, domain logons, the NET SEND command, or additional NetBIOS name resolution.

CCE Reference Number: CCE-36879-5
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.3.6

Compliance: Ensure 'MSS: (PerformRouterDiscovery) Allow IRDP to detect and configure Default Gateway addresses (could lead to DoS)' is set to 'Disabled'	**Trivial**

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (PerformRouterDiscovery) Allow IRDP to detect and configure Default Gateway addresses (could lead to DoS)

Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM), or available from this TechNet blog post: https://blogs.technet.microsoft.com/secguide/2016/10/02/the-mss-settings/>

Impact: Windows will not automatically detect and configure default gateway addresses on the computer.

Vulnerability Details

This setting is used to enable or disable the Internet Router Discovery Protocol (IRDP), which allows the system to detect and configure default gateway addresses automatically as described in RFC 1256 on a per-interface basis. The recommended state for this setting is: Disabled.

Rationale: An attacker who has gained control of a computer on the same network segment could configure a computer on the network to impersonate a router. Other computers with IRDP enabled would then attempt to route their traffic through the already compromised computer.

CCE Reference Number: CCE-38065-9

Compliance: Ensure 'MSS: (SafeDllSearchMode) Enable Safe DLL search mode (recommended)' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (SafeDllSearchMode) Enable Safe DLL search mode (recommended)

Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM).

Impact: Applications will be forced to search for DLLs in the system path first. For applications that require unique versions of these DLLs that are included with the application, this entry could cause performance or stability problems.

Vulnerability Details

The DLL search order can be configured to search for DLLs that are requested by running processes in one of two ways: Search folders specified in the system path first, and then search the current working folder. Search current working folder first, and then search the folders specified in the system path. When enabled, the registry value is set to 1. With a setting of 1, the system first searches the folders that are specified in the system path and then searches the current working folder. When disabled the registry value is set to 0 and the system first searches the current working folder and then searches the folders that are specified in the system path. The recommended state for this setting is: Enabled.

Rationale: If a user unknowingly executes hostile code that was packaged with additional files that include modified versions of system DLLs, the hostile code could load its own versions of those DLLs and potentially increase the type and degree of damage the code can render.

For applications that require unique versions of these DLLs that are included with the application, this entry could cause performance or stability problems. The recommended state for this setting is: Enabled.

Rationale: If a user unknowingly executes hostile code that was packaged with additional files that include modified versions of system DLLs, the hostile code could load its own versions of those DLLs and potentially increase the type and degree of damage the code can render.

CCE Reference Number: CCE-36351-5
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.3.8

False Positive Notes

Compliance: Ensure 'MSS: (ScreenSaverGracePeriod) The time in seconds before the screen saver grace period expires (0 recommended)' is set to 'Enabled: 5 or fewer seconds'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: 5 or fewer seconds: Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (ScreenSaverGracePeriod) The time in seconds before the screen saver grace period expires (0 recommended)

Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM).

Impact: Users will have to enter their passwords to resume their console sessions as soon as the screen saver activates.

Vulnerability Details

Windows includes a grace period between when the screen saver is launched and when the console is actually locked automatically when screen saver locking is enabled. The recommended state for this setting is: Enabled: 5 or fewer seconds.

Rationale: The default grace period that is allowed for user movement before the screen saver lock takes effect is five seconds. If you leave the default grace period configuration, your computer is vulnerable to a potential attack from someone who could approach the console and attempt to log on to the computer before the lock takes effect. An entry to the registry can be made to adjust the length of the grace period.

CCE Reference Number: CCE-37993-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.3.9

Compliance: Ensure 'MSS: (TcpMaxDataRetransmissions) How many times unacknowledged data is retransmitted' is set to 'Enabled: 3'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: 3:

<Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (TcpMaxDataRetransmissions) How many times unacknowledged data is retransmitted

Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM), or available from this TechNet blog post: https://blogs.technet.microsoft.com/secguide/2016/10/02/the-mss-settings/>

Impact: TCP starts a retransmission timer when each outbound segment is passed to the IP. If no acknowledgment is received for the data in a given segment before the timer expires, then the segment is retransmitted up to three times.

Vulnerability Details

This setting controls the number of times that TCP retransmits an individual data segment (non-connect segment) before the connection is aborted. The retransmission time-out is doubled with each successive retransmission on a connection. It is reset when responses resume. The base time-out value is dynamically determined by the measured round-trip time on the connection. The recommended state for this setting is: Enabled: 3.

Rationale: A malicious user could exhaust a target computer's resources if it never sent any acknowledgment messages for data that was transmitted by the target computer.

CCE Reference Number: CCE-36051-1
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.3.11

Compliance: Ensure 'MSS: (WarningLevel) Percentage threshold for the security event log at which the system will generate a warning' is set to 'Enabled: 90% or less'	**Trivial**

Vulnerability Details

This setting can generate a security audit in the Security event log when the log reaches a user-defined threshold.

Note: If log settings are configured to Overwrite events as needed or Overwrite events older than x days, this event will not be generated. The recommended state for this setting is: Enabled: 90% or less.

Rationale: If the Security log reaches 90 percent of its capacity and the computer has not been configured to overwrite events as needed, more recent events will not be written to the log. If the log reaches its capacity and the computer has been configured to shut down when it can no longer record events to the Security log, the computer will shut down and will no longer be available to provide network services.

CCE Reference Number: CCE-36880-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.3.12

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: 90% or less: Computer Configuration\Policies\Administrative Templates\MSS (Legacy)\MSS: (WarningLevel) Percentage threshold for the security event log at which the system will generate a warning

Note: This Group Policy path does not exist by default. An additional Group Policy template (MSS-legacy.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM).

Impact: This setting will generate an audit event when the Security log reaches the 90 percent-full threshold unless the log is configured to overwrite events as needed.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Network access: Allow anonymous SID/Name translation' is set to 'Disabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Allow anonymous SID/Name translation Impact: Disabled is the default configuration for this policy setting on member computers; therefore it will have no impact on them. The default configuration for domain controllers is Enabled. If you disable this policy setting on domain controllers, legacy computers may be unable to communicate with Windows Server 2003-based domains. For example, the following computers may not work: Windows NT 4.0-based Remote Access Service servers. Microsoft SQL Servers#x2122; that run on Windows NT 3.x-based or Windows NT 4.0-based computers. Remote Access Service or Microsoft SQL servers that run on Windows 2000-based computers and are located in Windows NT 3.x domains or Windows NT 4.0 domains.

Vulnerability Details

This policy setting determines whether an anonymous user can request security identifier (SID) attributes for another user, or use a SID to obtain its corresponding user name. Disable this policy setting to prevent unauthenticated users from obtaining user names that are associated with their respective SIDs. The recommended state for this setting is: Disabled.

Rationale: If this policy setting is enabled, a user with local access could use the well-known Administrator's SID to learn the real name of the built-in Administrator account, even if it has been renamed. That person could then use the account name to initiate a password guessing attack.

CCE Reference Number: CCE-36065-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.10.1

Compliance: Ensure 'Network access: Do not allow anonymous enumeration of SAM accounts and shares' is set to 'Enabled'	Trivial

Vulnerability Details

This policy setting controls the ability of anonymous users to enumerate SAM accounts as well as shares. If you enable this policy setting, anonymous users will not be able to enumerate domain account user names and network share names on the workstations in your environment.

The Network access: Do not allow anonymous enumeration of SAM accounts and shares setting is configured to Enabled for the two environments that are discussed in this guide. The recommended state for this setting is: Enabled.

Rationale: An unauthorized user could anonymously list account names and shared resources and use the information to attempt to guess passwords or perform social engineering attacks.

CCE Reference Number: CCE-36077-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.10.3

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Do not allow anonymous enumeration of SAM accounts and shares Impact: It will be impossible to grant access to users of another domain across a one-way trust because administrators in the trusting domain will be unable to enumerate lists of accounts in the other domain. Users who access file and print servers anonymously will be unable to list the shared network resources on those servers; the users will have to authenticate before they can view the lists of shared folders and printers.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Network access: Do not allow anonymous enumeration of SAM accounts and shares' is set to 'Enabled' (MS only)	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Do not allow anonymous enumeration of SAM accounts and shares>

Impact: It will be impossible to establish trusts with Windows NT 4.0-based domains. Also, client computers that run older versions of the Windows operating system such as Windows NT 3.51 and Windows 95 will experience problems when they try to use resources on the server. Users who access file and print servers anonymously will be unable to list the shared network resources on those servers; the users will have to authenticate before they can view the lists of shared folders and printers. However, even with this policy setting enabled, anonymous users will have access to resources with permissions that explicitly include the built-in group, ANONYMOUS LOGON.

Vulnerability Details

This policy setting controls the ability of anonymous users to enumerate SAM accounts as well as shares. If you enable this policy setting, anonymous users will not be able to enumerate domain account user names and network share names on the systems in your environment. The recommended state for this setting is: Enabled.

Note: This policy has no effect on domain controllers.

Rationale: An unauthorized user could anonymously list account names and shared resources and use the information to attempt to guess passwords or perform social engineering attacks. (Social engineering attacks try to deceive users in some way to obtain passwords or some form of security information.)

CCE Reference Number: CCE-36077-6

Compliance: Ensure 'Network access: Do not allow storage of passwords and credentials for network authentication' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Do not allow storage of passwords and credentials for network authentication>

Impact: Credential Manager will not store passwords and credentials on the computer. Users will be forced to enter passwords whenever they log on to their Passport account or other network resources that aren't accessible to their domain account. Testing has shown that clients running Windows Vista or Windows Server 2008 will be unable to connect to Distributed File System (DFS) shares in untrusted domains. Enabling this setting also makes it impossible to specify alternate credentials for scheduled tasks, this can cause a variety of problems. For example, some third party backup products will no longer work. This policy setting should have no impact on users who access network resources that are configured to allow access with their Active Directory-based domain account.

Vulnerability Details

This policy setting determines whether Credential Manager (formerly called Stored User Names and Passwords) saves passwords or credentials for later use when it gains domain authentication. The recommended state for this setting is: Enabled.

Note: Changes to this setting will not take effect until Windows is restarted.

Rationale: Passwords that are cached can be accessed by the user when logged on to the computer. Although this information may sound obvious, a problem can arise if the user unknowingly executes hostile code that reads the passwords and forwards them to another, unauthorized user.

CCE Reference Number: CCE-38119-4

Compliance: Ensure 'Network access: Remotely accessible registry paths'

Trivial

Vulnerability Details

This policy setting determines which registry paths will be accessible after referencing the WinReg key to determine access permissions to the paths. Note: This setting does not exist in Windows XP. There was a setting with that name in Windows XP, but it is called "Network access: Remotely accessible registry paths and sub-paths" in Windows Server 2003, Windows Vista, and Windows Server 2008. Note #2: When you configure this setting you specify a list of one or more objects. The delimiter used when entering the list is a line feed or carriage return, that is, type the first object on the list, press the Enter button, type the next object, press Enter again, etc. The setting value is stored as a comma-delimited list in group policy security templates. It is also rendered as a comma-delimited list in Group Policy Editor's display pane and the Resultant Set of Policy console. It is recorded in the registry as a line-feed delimited list in a REG_MULTI_SZ value. The recommended state for this setting is: System\CurrentControlSet\Control\ProductOptionsSystem\CurrentControlSet\Control\Server ApplicationsSoftware\Microsoft\Windows NT\CurrentVersion

Rationale: The registry is a database that contains computer configuration information, and much of the information is sensitive. An attacker could use this information to facilitate unauthorized activities. To reduce the risk of such an attack, suitable ACLs are assigned throughout the registry to help protect it from access by unauthorized users.

CCE Reference Number: CCE-37194-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.10.7

Solution Details

To establish the recommended configuration via GP, set the following UI path to: System\CurrentControlSet\Control\ProductOptionsSystem\CurrentControlSet\Control\Server ApplicationsSoftware\Microsoft\Windows NT\CurrentVersion Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Remotely accessible registry paths Impact: Remote management tools such as the Microsoft Baseline Security Analyzer and Microsoft Systems Management Server require remote access to the registry to properly monitor and manage those computers. If you remove the default registry paths from the list of accessible ones, such remote management tools could fail.

Note: If you want to allow remote access, you must also enable the Remote Registry service.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Server\DefaultUserConfigurationSoftware\Microsoft\Windows
NT\CurrentVersion\PerflibSystem\CurrentControlSet\Services\SysmonLog

The recommended state for servers that hold the Active Directory Certificate Services Role with Certification Authority Role Service includes the above list and: System\CurrentControlSet\Services\CertSvc The recommended state for servers that have the WINS Server Feature installed includes the above list and: System\CurrentControlSet\Services\WINS

Rationale: The registry contains sensitive computer configuration information that could be used by an attacker to facilitate unauthorized activities. The fact that the default ACLs assigned throughout the registry are fairly restrictive and help to protect the registry from access by unauthorized users reduces the risk of such an attack.

CCE Reference Number: CCE-36347-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.10.8

Compliance: Ensure 'Network access: Restrict anonymous access to Named Pipes and Shares' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Restrict anonymous access to Named Pipes and Shares Impact: You can enable this policy setting to restrict null session access for unauthenticated users to all server pipes and shared folders except those that are listed in the NullSessionPipes and NullSessionShares entries. If you choose to enable this setting and are supporting Windows NT 4.0 domains, you should check if any of the named pipes are required to maintain trust relationships between the domains, and then add the pipe to the Network access: Named pipes that can be accessed anonymously list:- COMNAP: SNA session access- COMNODE: SNA session access- SQL\QUERY: SQL instance access- SPOOLSS: Spooler service- LLSRPC: License Logging service- NETLOGON: Net Logon service- LSARPC: LSA access- SAMR: Remote access to SAM objects- BROWSER: Computer Browser service Previous to the release of Windows Server 2003 with Service Pack 1 (SP1) these named pipes were allowed anonymous access by default, but with the increased hardening in Windows Server 2003 with SP1 these pipes must be explicitly added if needed.

Vulnerability Details

When enabled, this policy setting restricts anonymous access to only those shares and pipes that are named in the Network access: Named pipes that can be accessed anonymously and Network access: Shares that can be accessed anonymously settings. This policy setting controls null session access to shares on your computers by adding RestrictNullSessAccess with the value 1 in the HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\LanManServer\Parameters registry key. This registry value toggles null session shares on or off to control whether the server service restricts unauthenticated clients' access to named resources. The recommended state for this setting is: Enabled.

Rationale: Null sessions are a weakness that can be exploited through shares (including the default shares) on computers in your environment.

CCE Reference Number: CCE-36021-4
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.10.9

False Positive Notes

Compliance: Ensure 'Network access: Restrict clients allowed to make remote calls to SAM' is set to 'Administrators: Remote Access: Allow' (MS only)	Trivial

Vulnerability Details

This policy setting allows you to restrict remote RPC connections to SAM. The recommended state for this setting is: Administrators: Remote Access: Allow.

Note: A Windows 10 R1607, Server 2016 or higher OS is required to access and set this value in Group Policy.

Rationale: To ensure that an unauthorized user cannot anonymously list local account names or groups and use the information to attempt to guess passwords or perform social engineering attacks. (Social engineering attacks try to deceive users in some way to obtain passwords or some form of security information.) CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.10.10

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Remote Access: Allow:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network access: Restrict clients allowed to make remote calls to SAM>

Impact: None - this is the default configuration.

Compliance: Ensure 'Network access: Sharing and security model for local accounts' is set to 'Classic - local users authenticate as themselves'

Trivial

Vulnerability Details

This policy setting determines how network logons that use local accounts are authenticated. The Classic option allows precise control over access to resources, including the ability to assign different types of access to different users for the same resource. The Guest only option allows you to treat all users equally. In this context, all users authenticate as Guest only to receive the same access level to a given resource. The recommended state for this setting is: Classic - local users authenticate as themselves.

Rationale: With the Guest only model, any user who can authenticate to your computer over the network does so with guest privileges, which probably means that they will not have write access to shared resources on that computer. Although this restriction does increase security, it makes it more difficult for authorized users to access shared resources on those computers because ACLs on those resources must include access control entries (ACEs) for the Guest account. With the Classic model, local accounts should be password protected. Otherwise, if Guest access is enabled, anyone can use those user accounts to access shared system resources.

CCE Reference Number: CCE-37623-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.10.11

False Positive Notes

Compliance: Ensure 'Network security: Allow Local System to use computer identity for NTLM' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network security: Allow Local System to use computer identity for NTLM Impact: If you enable this policy setting, services running as Local System that use Negotiate will use the computer identity. This might cause some authentication requests between Windows operating systems to fail and log an error. If you disable this policy setting, services running as Local System that use Negotiate when reverting to NTLM authentication will authenticate anonymously. This was the behavior in previous versions of Windows.

Vulnerability Details

When enabled, this policy setting causes Local System services that use Negotiate to use the computer identity when NTLM authentication is selected by the negotiation. This policy is supported on at least Windows 7 or Windows Server 2008 R2. The recommended state for this setting is: Enabled.

Rationale: When connecting to computers running versions of Windows earlier than Windows Vista or Windows Server 2008, services running as Local System and using SPNEGO (Negotiate) that revert to NTLM use the computer identity. In Windows 7, if you are connecting to a computer running Windows Server 2008 or Windows Vista, then a system service uses either the computer identity or a NULL session. When connecting with a NULL session, a system-generated session key is created, which provides no protection but allows applications to sign and encrypt data without errors. When connecting with the computer identity, both signing and encryption is supported in order to provide data protection.

CCE Reference Number: CCE-38341-4
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.11.1

Compliance: Ensure 'Network Security: Allow PKU2U authentication requests to this computer to use online identities' is set to 'Disabled'	Trivial

Vulnerability Details

This setting determines if online identities are able to authenticate to this computer. Windows 7 and Windows Server 2008 R2 introduced an extension to the Negotiate authentication package, Spnego.dll. In previous versions of Windows, Negotiate decides whether to use Kerberos or NTLM for authentication. The extension SSP for Negotiate, Negoexts, which is treated as an authentication protocol by Windows, supports Microsoft SSPs including PKU2U. When computers are configured to accept authentication requests by using online IDs, Negoexts.dll calls the PKU2U SSP on the computer that is used to log on. The PKU2U SSP obtains a local certificate and exchanges the policy between the peer computers. When validated on the peer computer, the certificate within the metadata is sent to the logon peer for validation and associates the user's certificate to a security token and the logon process completes. The recommended state for this setting is: Disabled.

Rationale: The PKU2U protocol is a peer-to-peer authentication protocol, in most managed networks authentication should be managed centrally.

CCE Reference Number: CCE-38047-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.11.3

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network Security: Allow PKU2U authentication requests to this computer to use online identities Impact: Disabling this setting will disallow the online identities to be able to authenticate to the domain joined machine in Windows 7 and later.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

There are no references for this vulnerability.

Compliance: Ensure 'Network Security: Allow PKU2U authentication requests to this computer to use online identities' is set to 'Disabled' | Trivial

Vulnerability Details

This setting determines if online identities are able to authenticate to this computer. The Public Key Cryptography Based User-to-User (PKU2U) protocol introduced in Windows 7 and Windows Server 2008 R2 is implemented as a security support provider (SSP). The SSP enables peer-to-peer authentication, particularly through the Windows 7 media and file sharing feature called Homegroup, which permits sharing between computers that are not members of a domain. With PKU2U, a new extension was introduced to the Negotiate authentication package, Spnego.dll. In previous versions of Windows, Negotiate decided whether to use Kerberos or NTLM for authentication. The extension SSP for Negotiate, Negoexts.dll, which is treated as an authentication protocol by Windows, supports Microsoft SSPs including PKU2U. When computers are configured to accept authentication requests by using online IDs, Negoexts.dll calls the PKU2U SSP on the computer that is used to log on. The PKU2U SSP obtains a local certificate and exchanges the policy between the peer computers. When validated on the peer computer, the certificate within the metadata is sent to the logon peer for validation and associates the user's certificate to a security token and the logon process completes. The recommended state for this setting is: Disabled.

Rationale: The PKU2U protocol is a peer-to-peer authentication protocol - authentication should be managed centrally in most managed networks.

CCE Reference Number: CCE-38047-7
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.11.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network Security: Allow PKU2U authentication requests to this computer to use online identities>

Impact: None - this is the default configuration for domain-joined computers.

False Positive Notes

Compliance: Ensure 'Network security: Configure encryption types allowed for Kerberos' is set to 'RC4_HMAC_MD5, AES128_HMAC_SHA1, AES256_HMAC_SHA1, Future encryption types'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to RC4_HMAC_MD5, AES128_HMAC_SHA1, AES256_HMAC_SHA1, Future encryption types:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network security: Configure encryption types allowed for Kerberos>

Impact: None - this is the default configuration. If not selected, the encryption type will not be allowed. This setting may affect compatibility with client computers or services and applications. Multiple selections are permitted. Note: Windows Server 2008 (non-R2) and below allow DES for Kerberos by default, but later OS versions do not.

Vulnerability Details

This policy setting allows you to set the encryption types that Kerberos is allowed to use. The recommended state for this setting is: RC4_HMAC_MD5, AES128_HMAC_SHA1, AES256_HMAC_SHA1, Future encryption types.

Rationale: The strength of each encryption algorithm varies from one to the next, choosing stronger algorithms will reduce the risk of compromise however doing so may cause issues when the computer attempts to authenticate with systems that do not support them.

CCE Reference Number: CCE-37755-6
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.11.4

Compliance: Ensure 'Network security: Do not store LAN Manager hash value on next password change' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network security: Do not store LAN Manager hash value on next password change Impact: Earlier operating systems such as Windows 95, Windows 98, and Windows ME as well as some third-party applications will fail.

Vulnerability Details

This policy setting determines whether the LAN Manager (LM) hash value for the new password is stored when the password is changed. The LM hash is relatively weak and prone to attack compared to the cryptographically stronger Microsoft Windows NT hash. Note: Older operating systems and some third-party applications may fail when this policy setting is enabled. Also, note that the password will need to be changed on all accounts after you enable this setting to gain the proper benefit. The recommended state for this setting is: Enabled.

Rationale: The SAM file can be targeted by attackers who seek access to username and password hashes. Such attacks use special tools to crack passwords, which can then be used to impersonate users and gain access to resources on your network. These types of attacks will not be prevented if you enable this policy setting, but it will be much more difficult for these types of attacks to succeed.

CCE Reference Number: CCE-36326-7

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled. Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network security: Force logoff when logon hours expire Impact: When a user's logon time expires, SMB sessions will terminate. The user will be unable to log on to the computer until their next scheduled access time commences.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Network security: Force logoff when logon hours expire' is set to 'Enabled' — Trivial

Vulnerability Details

This policy setting determines whether to disconnect users who are connected to the local computer outside their user account's valid logon hours. This setting affects the Server Message Block (SMB) component. If you enable this policy setting you should also enable Microsoft network server: Disconnect clients when logon hours expire (Rule 2.3.9.4). The recommended state for this setting is: Enabled.

Rationale: If this setting is disabled, a user could remain connected to the computer outside of their allotted logon hours.

CCE Reference Number: CCE-36270-7
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.11.6

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled.

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network security: Force logoff when logon hours expire>

Impact: None - this is the default configuration.

Compliance: Ensure 'Network security: LAN Manager authentication level' is set to 'Send NTLMv2 response only. Refuse LM & NTLM' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to: Send NTLMv2 response only. Refuse LM & NTLM: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network security: LAN Manager authentication level Impact: Clients that do not support NTLMv2 authentication will not be able to authenticate in the domain and access domain resources by using LM and NTLM. Note: For information about a hotfix to ensure that this setting works in networks that include Windows NT 4.0-based computers along with Windows 2000, Windows XP, and Windows Server 2003-based computers, see Microsoft Knowledge Base article 305379: Authentication Problems in Windows 2000 with NTLM 2 Levels Above 2 in a Windows NT 4.0 Domain.

Vulnerability Details

LAN Manager (LM) is a family of early Microsoft client/server software that allows users to link personal computers together on a single network. Network capabilities include transparent file and print sharing, user security features, and network administration tools. In Active Directory domains, the Kerberos protocol is the default authentication protocol. However, if the Kerberos protocol is not negotiated for some reason, Active Directory will use LM, NTLM, or NTLMv2. LAN Manager authentication includes the LM, NTLM, and NTLM version 2 (NTLMv2) variants, and is the protocol that is used to authenticate all Windows clients when they perform the following operations: Join a domain Authenticate between Active Directory forests Authenticate to down-level domains Authenticate to computers that do not run Windows 2000, Windows Server 2003, or Windows XP) Authenticate to computers that are not in the domain The possible values for the Network security: LAN Manager authentication level setting are: Send LM & NTLM responses Send LM & NTLM #x2014; use NTLMv2 session security if negotiated Send NTLM responses only Send NTLMv2 responses only Send NTLMv2 responses only\refuse LM Send NTLMv2 responses only\refuse LM & NTLM Not Defined The Network security: LAN Manager authentication level setting determines which challenge/response authentication protocol is used for network logons. This choice affects the authentication protocol level that clients use, the session security level that the computers negotiate, and the authentication level that servers accept as follows: Send LM & NTLM responses. Clients use LM and NTLM authentication and never use NTLMv2 session security. Domain controllers accept LM, NTLM, and NTLMv2 authentication. Send LM & NTLM - use NTLMv2 session security if negotiated. Clients use LM and NTLM authentication and use NTLMv2 session security if the server supports it. Domain controllers accept LM, NTLM, and NTLMv2 authentication. Send NTLM response only. Clients use NTLM authentication only and use NTLMv2 session security if the server supports it. Domain controllers accept LM, NTLM, and NTLMv2 authentication. Send NTLMv2 response only. Clients use NTLMv2 authentication only and use NTLMv2 session security if the server supports it. Domain controllers accept LM, NTLM, and NTLMv2 authentication. Send NTLMv2 response only\refuse LM. Clients use NTLMv2 authentication only and use NTLMv2 session security if the server supports it. Domain controllers refuse LM (accept only NTLM and NTLMv2 authentication). Send NTLMv2 response only\refuse LM & NTLM. Clients use NTLMv2 authentication only and use NTLMv2 session security if the server supports it. Domain controllers refuse LM and NTLM (accept only NTLMv2 authentication). These settings correspond to the levels discussed in other Microsoft documents as follows: Level 0 - Send LM and NTLM response; never use NTLMv2 session security. Clients use LM and NTLM authentication, and never use NTLMv2 session security. Domain controllers accept LM, NTLM, and NTLMv2 authentication. Level 1 - Use NTLMv2 session security if negotiated. Clients use LM and NTLM authentication, and use NTLMv2 session security if the server supports it. Domain controllers accept LM, NTLM, and NTLMv2 authentication. Level 2 - Send NTLM response only. Clients use only NTLM authentication, and use NTLMv2 session security if the server supports it. Domain controllers accept LM, NTLM, and NTLMv2 authentication. Level 3 - Send NTLMv2 response only. Clients use NTLMv2 authentication, and use NTLMv2 session security if the server supports it. Domain controllers accept LM, NTLM, and NTLMv2 authentication. Level 4 - Domain controllers refuse LM responses. Clients use NTLM authentication, and use NTLMv2 session security if the server supports it. Domain controllers refuse LM authentication, that is, they accept NTLM and NTLMv2. Level 5 - Domain controllers refuse LM and NTLM responses (accept only NTLMv2). Clients use NTLMv2 authentication, use and NTLMv2 session security if the server supports it. Domain controllers refuse NTLM and LM authentication (they accept only NTLMv2). The recommended state for this setting is: Send NTLMv2 response only. Refuse LM & NTLM.

Rationale: In Windows Vista, this setting is undefined. However, in Windows 2000, Windows Server 2003, and Windows XP clients are configured by default to send LM and NTLM authentication responses (Windows 95-based and Windows 98-based clients only send LM). The default setting on servers allows all clients to authenticate with servers and use their resources. However, this means that LM responses#x2014;the weakest form of authentication response#x2014;are sent over the network, and it is potentially possible for attackers to sniff that traffic to more easily reproduce the user's password. The Windows 95, Windows 98, and Windows NT operating systems cannot use the Kerberos version 5 protocol for authentication. For this reason, in a Windows Server 2003 domain, these computers authenticate by default with both the LM and NTLM protocols for network authentication. You can enforce a more secure authentication protocol for Windows 95, Windows 98, and Windows NT by using NTLMv2. For the logon process, NTLMv2 uses a secure channel to protect the authentication process. Even if you use NTLMv2 for earlier clients and servers, Windows-based clients and servers that are members of the domain will use the Kerberos authentication protocol to authenticate with Windows Server 2003 domain controllers.

CCE Reference Number: CCE-36173-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.11.7

Compliance: Ensure 'Network security: LAN Manager authentication level' is set to 'Send NTLMv2 response only. Refuse LM&NTLM'

Trivial

Vulnerability Details

LAN Manager (LM) was a family of early Microsoft client/server software (predating Windows NT) that allowed users to link personal computers together on a single network. LM network capabilities included transparent file and print sharing, user security features, and network administration tools. In Active Directory domains, the Kerberos protocol is the default authentication protocol. However, if the Kerberos protocol is not negotiated for some reason, Active Directory will use LM, NTLM, or NTLMv2. LAN Manager authentication includes the LM, NTLM, and NTLM version 2 (NTLMv2) variants, and is the protocol that is used to authenticate all Windows clients when they perform the following operations:

Join a domain Authenticate between Active Directory forests Authenticate to down-level domains Authenticate to computers that do not run Windows 2000, Windows Server 2003, or Windows XP Authenticate to computers that are not in the domain. The Network security: LAN Manager authentication level setting determines which challenge/response authentication protocol is used for network logons. This choice affects the level of authentication protocol used by clients, the level of session security negotiated, and the level of authentication accepted by servers. The recommended state for this setting is: Send NTLMv2 response only. Refuse LM & NTLM.

Rationale: Windows 2000 and Windows XP clients were configured by default to send LM and NTLM authentication responses (Windows 95-based and Windows 98-based clients only send LM). The default settings in OSes predating Windows Vista / Windows Server 2008 (non-R2) allowed all clients to authenticate with servers and use their resources. However, this meant that LM responses - the weakest form of authentication response - were sent over the network, and it was potentially possible for attackers to sniff that traffic to more easily reproduce the user's password. The Windows 95, Windows 98, and Windows NT operating systems cannot use the Kerberos version 5 protocol for authentication. For this reason, in a Windows Server 2003 domain, these computers authenticate by default with both the LM and NTLM protocols for network authentication. You can enforce a more secure authentication protocol for Windows 95, Windows 98, and Windows NT by using NTLMv2. For the logon process, NTLMv2 uses a secure channel to protect the authentication process. Even if you use NTLMv2 for earlier clients and servers, Windows-based clients and servers that are members of the domain will use the Kerberos authentication protocol to authenticate with Windows Server 2003 or higher domain controllers. For these reasons, it is strongly preferred to restrict the use of LM & NTLM (non-v2) as much as possible.

CCE Reference Number: CCE-36173-3
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.11.7

Solution Details

To establish the recommended configuration via GP, set the following UI path to: Send NTLMv2 response only. Refuse LM & NTLM:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network security: LAN Manager authentication level>

Impact: Clients use NTLMv2 authentication only and use NTLMv2 session security if the server supports it; domain controllers refuse LM and NTLM (accept only NTLMv2 authentication). Clients that do not support NTLMv2 authentication will not be able to authenticate in the domain and access domain resources by using LM and NTLM. Note: For information about a hotfix to ensure that this setting works in networks that include Windows NT 4.0-based computers along with Windows 2000, Windows XP, and Windows Server 2003-based computers, see Microsoft Knowledge Base article 305379: Authentication Problems in Windows 2000 with NTLM 2 Levels Above 2 in a Windows NT 4.0 Domain.

Compliance: Ensure 'Network security: LDAP client signing requirements' is set to 'Negotiate signing' or higher	Trivial

Vulnerability Details

This policy setting determines the level of data signing that is requested on behalf of clients that issue LDAP BIND requests, as follows:- None. The LDAP BIND request is issued with the caller-specified options.- Negotiate signing. If Transport Layer Security/Secure Sockets Layer (TLS/SSL) has not been started, the LDAP BIND request is initiated with the LDAP data signing option set in addition to the caller-specified options. If TLS/SSL has been started, the LDAP BIND request is initiated with the caller-specified options.- Require signature. This level is the same as Negotiate signing. However, if the LDAP server's intermediate saslBindInProgress response does not indicate that LDAP traffic signing is required, the caller is told that the LDAP BIND command request failed. Note: This policy setting does not have any impact on ldap_simple_bind or ldap_simple_bind_s. No Microsoft LDAP clients that are included with Windows XP Professional use ldap_simple_bind or ldap_simple_bind_s to communicate with a domain controller. The possible values for the Network security: LDAP client signing requirements setting are:- None- Negotiate signing- Require signature- Not Defined The recommended state for this setting is: Negotiate signing. Configuring this setting to Require signing also conforms with the benchmark.

Rationale: Unsigned network traffic is susceptible to man-in-the-middle attacks in which an intruder captures the packets between the client and server, modifies them, and then forwards them to the server. For an LDAP server, this susceptibility means that an attacker could cause a server to make decisions that are based on false or altered data from the LDAP queries. To lower this risk in your network, you can implement strong physical security measures to protect the network infrastructure. Also, you can make all types of man-in-the-middle attacks extremely difficult if you require digital signatures on all network packets by means of IPsec authentication headers.

CCE Reference Number: CCE-36858-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.11.8

Solution Details

To establish the recommended configuration via GP, set the following UI path to Negotiate signing (configuring to Require signing also conforms with the benchmark): Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network security: LDAP client signing requirements Impact: If you configure the server to require LDAP signatures you must also configure the client. If you do not configure the client it will not be able to communicate with the server, which could cause many features to fail, including user authentication, Group Policy, and logon scripts.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Network security: Minimum session security for NTLM SSP based (including secure RPC) clients' is set to 'Require NTLMv2 session security, Require 128-bit encryption'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Require NTLMv2 session security, Require 128-bit encryption: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Network security: Minimum session security for NTLM SSP based (including secure RPC) clients Impact: Client applications that are enforcing these settings will be unable to communicate with older servers that do not support them. This setting could impact Windows Clustering when applied to servers running Windows Server 2003, see Microsoft Knowledge Base articles 891597: How to apply more restrictive security settings on a Windows Server 2003-based cluster server and 890761: You receive an "Error 0x8007042b" error message when you add or join a node to a cluster if you use NTLM version 2 in Windows Server 2003 for more information on possible issues and how to resolve them.

Vulnerability Details

This policy setting determines which behaviors are allowed for applications using the NTLM Security Support Provider (SSP). The SSP Interface (SSPI) is used by applications that need authentication services. The setting does not modify how the authentication sequence works but instead require certain behaviors in applications that use the SSPI. The possible values for the Network security: Minimum session security for NTLM SSP based (including secure RPC) clients setting are:- Requires message confidentiality. This option is only available in Windows XP and Windows Server 2003, the connection will fail if encryption is not negotiated. Encryption converts data into a form that is not readable until decrypted.- Require message integrity. This option is only available in Windows XP and Windows Server 2003, the connection will fail if message integrity is not negotiated. The integrity of a message can be assessed through message signing. Message signing proves that the message has not been tampered with; it attaches a cryptographic signature that identifies the sender and is a numeric representation of the contents of the message.- Require 128-bit encryption. The connection will fail if strong encryption (128-bit) is not negotiated.- Require NTLMv2 session security. The connection will fail if the NTLMv2 protocol is not negotiated.- Not Defined. The recommended state for this setting is: Require NTLMv2 session security, Require 128-bit encryption.

Rationale: You can enable all of the options for this policy setting to help protect network traffic that uses the NTLM Security Support Provider (NTLM SSP) from being exposed or tampered with by an attacker who has gained access to the same network. In other words, these options help protect against man-in-the-middle attacks.

CCE Reference Number: CCE-37553-5

Compliance: Ensure 'No auto-restart with logged on users for scheduled automatic updates installations' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Update\No auto-restart with logged on users for scheduled automatic updates installations Impact: If you enable this policy setting, the operating systems on the servers in your environment will restart themselves automatically. For critical servers this could lead to a temporary denial of service (DoS) condition.

Vulnerability Details

This policy setting specifies that Automatic Updates will wait for computers to be restarted by the users who are logged on to them to complete a scheduled installation. If you enable the No auto-restart for scheduled Automatic Updates installations setting, Automatic Updates does not restart computers automatically during scheduled installations. Instead, Automatic Updates notifies users to restart their computers to complete the installations. You should note that Automatic Updates will not be able to detect future updates until restarts occur on the affected computers. If you disable or do not configure this setting, Automatic Updates will notify users that their computers will automatically restart in 5 minutes to complete the installations. The possible values for the No auto-restart for scheduled Automatic Updates installations setting are:- Enabled- Disabled- Not Configured

Note: This setting applies only when you configure Automatic Updates to perform scheduled update installations. If you configure the Configure Automatic Updates setting to Disabled, this setting has no effect. The recommended state for this setting is: Disabled.

Rationale: Sometimes updates require updated computers to be restarted to complete an installation. If the computer cannot restart automatically, then the most recent update will not completely install and no new updates will download to the computer until it is restarted.

Compliance: Ensure 'Notify antivirus programs when opening attachments' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: User Configuration\Policies\Administrative Templates\Windows Components\Attachment Manager\Notify antivirus programs when opening attachments Impact: When the Notify antivirus programs when opening attachments setting is Enabled, every downloaded file or e-mail attachment that the user opens will be scanned.

Vulnerability Details

Antivirus programs are mandatory in many environments and provide a strong defense against attack. The Notify antivirus programs when opening attachments setting allows you to manage how registered antivirus programs are notified. When enabled, this policy setting configures Windows to call the registered antivirus program and have it scan file attachments when they are opened by users. If the antivirus scan fails, the attachments are blocked from being opened. If this policy setting is disabled, Windows does not call the registered antivirus program when file attachments are opened. The recommended state for this setting is: Enabled. Note: An updated antivirus program must be installed for this policy setting to function properly.

Rationale: Antivirus programs that do not perform on-access checks may not be able to scan downloaded files.

CCE Reference Number: CCE-36622-9

Compliance: Ensure 'Password must meet complexity requirements' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Account Policies\Password Policy\Password must meet complexity requirements Impact: If the default password complexity configuration is retained, additional help desk calls for locked-out accounts could occur because users might not be accustomed to passwords that contain non-alphabetic characters. However, all users should be able to comply with the complexity requirement with minimal difficulty. If your organization has more stringent security requirements, you can create a custom version of the Passfilt.dll file that allows the use of arbitrarily complex password strength rules.

For example, a custom password filter might require the use of non-upper row characters. (Upper row characters are those that require you to hold down the SHIFT key and press any of the digits between 1 and 0.) A custom password filter might also perform a dictionary check to verify that the proposed password does not contain common dictionary words or fragments. Also, the use of ALT key character combinations can greatly enhance the complexity of a password. However, such stringent password requirements can result in unhappy users and an extremely busy help desk. Alternatively, your organization could consider a requirement for all administrator passwords to use ALT characters in the 01280159 range. (ALT characters outside of this range can represent standard alphanumeric characters that would not add additional complexity to the password.)

Vulnerability Details

This policy setting checks all new passwords to ensure that they meet basic requirements for strong passwords. When this policy is enabled, passwords must meet the following minimum requirements:- Not contain the user's account name or parts of the user's full name that exceed two consecutive characters- Be at least six characters in length- Contain characters from three of the following four categories:- English uppercase characters (A through Z)- English lowercase characters (a through z)- Base 10 digits (0 through 9)- Non-alphabetic characters (for example, !, $, #, %)- A catch-all category of any Unicode character that does not fall under the previous four categories. This fifth category can be regionally specific. Each additional character in a password increases its complexity exponentially. For instance, a seven-character, all lower-case alphabetic password would have 267 (approximately 8 x 109 or 8 billion) possible combinations. At 1,000,000 attempts per second (a capability of many password-cracking utilities), it would only take 133 minutes to crack. A seven-character alphabetic password with case sensitivity has 527 combinations. A seven-character case-sensitive alphanumeric password without punctuation has 627 combinations. An eight-character password has 268 (or 2 x 1011) possible combinations. Although this might seem to be a large number, at 1,000,000 attempts per second it would take only 59 hours to try all possible passwords. Remember, these times will significantly increase for passwords that use ALT characters and other special keyboard characters such as "!" or "@". Proper use of the password settings can help make it difficult to mount a brute force attack. The recommended state for this setting is: Enabled.

Rationale: Passwords that contain only alphanumeric characters are extremely easy to discover with several publicly available tools.

CCE Reference Number: CCE-37063-5

Compliance: Ensure 'Password Settings: Password Age (Days)' is set to 'Enabled: 30 or fewer' (MS only) — Trivial

Vulnerability Details

In May 2015, Microsoft released the Local Administrator Password Solution (LAPS) tool, which is free and supported software that allows an organization to automatically set randomized and unique local Administrator account passwords on domain-attached workstations and member servers. The passwords are stored in a confidential attribute of the domain computer account and can be retrieved from Active Directory by approved Sysadmins when needed. The LAPS tool requires a small Active Directory Schema update in order to implement, as well as installation of a Group Policy Client Side Extension (CSE) on targeted computers. Please see the LAPS documentation for details. LAPS supports Windows Vista or newer workstation OSes, and Server 2003 or newer server OSes. LAPS does not support standalone computers - they must be joined to a domain. The recommended state for this setting is: Enabled: 30 or fewer.

Note: Organizations that utilize 3rd-party commercial software to manage unique & complex local Administrator passwords on domain members may opt to disregard these LAPS recommendations.

Rationale: Due to the difficulty in managing local Administrator passwords, many organizations choose to use the same password on all workstations and/or member servers when deploying them. This poses a serious attack surface security risk because if an attacker manages to compromise one system and learn the password to its local Administrator account, then they can leverage that account to instantly gain access to all other computers that also use that password for their local Administrator account. CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.2.6

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled, and configure the Password Age (Days) option to 30 or fewer: Computer Configuration\Policies\Administrative Templates\LAPS\Password Settings

Note: This Group Policy path does not exist by default. An additional Group Policy template (AdmPwd.admx/adml) is required - it is included with Microsoft Local Administrator Password Solution (LAPS). Impact: Requires a maximum password age of 30 days or less.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.1.1.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Control Panel\Personalization\Prevent enabling lock screen camera Impact: If you enable this setting, users will no longer be able to enable or disable lock screen camera access in PC Settings, and the camera cannot be invoked on the lock screen.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Prevent enabling lock screen camera' is set to 'Enabled' — Trivial

Vulnerability Details

Disables the lock screen camera toggle switch in PC Settings and prevents a camera from being invoked on the lock screen. The recommended state for this setting is: Enabled.

Rationale: Disabling the lock screen camera extends the protection afforded by the lock screen to camera features.

CCE Reference Number: CCE-38347-1
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.1.1.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Control Panel\Personalization\Prevent enabling lock screen camera>

Impact: If you enable this setting, users will no longer be able to enable or disable lock screen camera access in PC Settings, and the camera cannot be invoked on the lock screen.

CVSS Base Score: 0

Compliance: Ensure 'Prevent Internet Explorer security prompt for Windows Installer scripts' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Installer\Prevent Internet Explorer security prompt for Windows Installer scripts>

Impact: None - this is the default configuration.

Vulnerability Details

This policy setting controls whether Web-based programs are allowed to install software on the computer without notifying the user. The recommended state for this setting is: Disabled.

Rationale: Suppressing the system warning can pose a security risk and increase the attack surface on the system.

CCE Reference Number: CCE-37524-6
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.74.3

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Prevent the usage of OneDrive for file storage' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\OneDrive\Prevent the usage of OneDrive for file storage

Note: This Group Policy path may not exist by default. An additional Group Policy template (SkyDrive.admx/adml) may be required - we strongly recommend you only use the version included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer). Older versions of the templates had conflicting settings in different template files for both OneDrive & SkyDrive, until it was cleaned up properly in the above version.

Impact: Users can't access OneDrive from the OneDrive app and file picker. Windows Store apps can't access OneDrive using the WinRT API. OneDrive doesn't appear in the navigation pane in File Explorer. OneDrive files aren't kept in sync with the cloud. Users can't automatically upload photos and videos from the camera roll folder.

Note: If your organization uses Office 365, be aware that this setting will prevent users from saving files to OneDrive/SkyDrive.

Vulnerability Details

This policy setting lets you prevent apps and features from working with files on OneDrive using the Next Generation Sync Client. The recommended state for this setting is: Enabled.

Rationale: Enabling this setting prevents users from accidentally uploading confidential or sensitive corporate information to the OneDrive cloud service using the Next Generation Sync Client.

CCE Reference Number: CCE-36939-7
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.47.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Prevent the usage of SkyDrive for file storage' is set to 'Enabled'

Trivial

Vulnerability Details

This policy setting lets you prevent apps and features from working with files on SkyDrive. The recommended state for this setting is: Enabled.

Rationale: Enabling this setting prevents users from accidentally uploading confidential or sensitive corporate information to SkyDrive cloud service.

CCE Reference Number: CCE-33826-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.54.1

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\SkyDrive\Prevent the usage of SkyDrive for file storage

Note: This Group Policy path may not exist by default. An additional Group Policy template (SkyDrive.admx/adml) may be required - it is included with the Microsoft Windows 8.1/2012R2 Administrative Templates. Due to conflicting settings with the newer Windows 10 template of the same name, we recommend renaming the Windows 10 template to "OneDrive.admx/adml" before adding it to your ADMX repository or Central Store, so both versions can coexist. Likewise, ensure that any Windows 8.1/2012R2 versioned template is named "SkyDrive.admx/adml" before placing it in your ADMX repository or Central Store.

Impact: If you enable this policy setting: Users can't access SkyDrive from the SkyDrive app and file picker. Windows Store apps can't access SkyDrive using the WinRT API. SkyDrive doesn't appear in the navigation pane in File Explorer. SkyDrive files aren't kept in sync with the cloud. Users can't automatically upload photos and videos from the camera roll folder. If you disable or do not configure this policy setting apps and features can work with SkyDrive file storage.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Prevent users from sharing files within their profile.' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: User Configuration\Policies\Administrative Templates\Windows Components\Network Sharing\Prevent users from sharing files within their profile. Impact: If you enable this policy setting, users cannot share files within their profile using the sharing wizard. Also, the sharing wizard cannot create a share at %root%\users and can only be used to create SMB shares on folders.

Vulnerability Details

This policy setting specifies whether users can share files within their profile. By default users are allowed to share files within their profile to other users on their network after an administrator opts in the computer. An administrator can opt in the computer by using the sharing wizard to share a file within their profile. The recommended state for this setting is: Enabled.

Rationale: If not properly controlled a user could accidentally share sensitive data with unauthorized users. In a corporate environment, the company should provide a managed location for file sharing, such as a file server or SharePoint.

CCE Reference Number: CCE-38070-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 19.7.25.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Prevent using Localhost IP address for WebRTC' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Microsoft Edge\Prevent using Localhost IP address for WebRTC>

Impact: The employee's LocalHost IP address will be hidden while making phone calls using WebRTC.

Vulnerability Details

This setting lets you decide whether an employee's LocalHost IP address shows while making phone calls using the WebRTC protocol. The recommended state for this setting is: Enabled.

Rationale: WebRTC is a Real-Time Communications open source project supported by all major browsers. Allowing a system's local IP address to be shared may be considered a privacy concern.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.41.11

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Profile single process' is set to 'Administrators'

Trivial

Vulnerability Details

This policy setting determines which users can use tools to monitor the performance of non-system processes. Typically, you do not need to configure this user right to use the Microsoft Management Console (MMC) Performance snap-in. However, you do need this user right if System Monitor is configured to collect data using Windows Management Instrumentation (WMI). Restricting the Profile single process user right prevents intruders from gaining additional information that could be used to mount an attack on the system. The recommended state for this setting is: Administrators.

Rationale: The Profile single process user right presents a moderate vulnerability. An attacker with this user right could monitor a computer's performance to help identify critical processes that they might wish to attack directly. The attacker may also be able to determine what processes run on the computer so that they could identify countermeasures that they may need to avoid, such as antivirus software, an intrusion-detection system, or which other users are logged on to a computer.

CCE Reference Number: CCE-37131-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.34

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Profile single process Impact: If you remove the Profile single process user right from the Power Users group or other accounts, you could limit the abilities of users who are assigned to specific administrative roles in your environment. You should ensure that delegated tasks will not be negatively affected.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Ensure 'Profile system performance' is set to 'Administrators, NT SERVICE\WdiServiceHost'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators, NT SERVICE\WdiServiceHost : Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Profile system performance Impact: None. This is the default configuration.

Vulnerability Details

This policy setting allows users to use tools to view the performance of different system processes, which could be abused to allow attackers to determine a system's active processes and provide insight into the potential attack surface of the computer. The recommended state for this setting is: Administrators, NT SERVICE\WdiServiceHost.

Rationale: The Profile system performance user right poses a moderate vulnerability. Attackers with this user right could monitor a computer's performance to help identify critical processes that they might wish to attack directly. Attackers may also be able to determine what processes are active on the computer so that they could identify countermeasures that they may need to avoid, such as antivirus software or an intrusion detection system.

Compliance: Ensure 'Prohibit access of the Windows Connect Now wizards' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Network\Network\Windows Connect Now\Prohibit access of the Windows Connect Now wizards>

Impact: The WCN wizards are turned off and users have no access to any of the wizard tasks. All the configuration related tasks including "Set up a wireless router or access point" and "Add a wireless device" are disabled.

Vulnerability Details

This policy setting prohibits access to Windows Connect Now (WCN) wizards. The recommended state for this setting is: Enabled.

Rationale: Allowing standard users to access the Windows Connect Now wizard increases the risk and attack surface.

CCE Reference Number: CCE-36109-7

Compliance: Ensure 'Prohibit connection to non-domain networks when connected to domain authenticated network' is set to 'Enabled' (MS only)

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Network\Windows Connection Manager\Prohibit connection to non-domain networks when connected to domain authenticated network>

Impact: The computer responds to automatic and manual network connection attempts based on the following circumstances: Automatic connection attempts - When the computer is already connected to a domain based network, all automatic connection attempts to non-domain networks are blocked. - When the computer is already connected to a non-domain based network, automatic connection attempts to domain based networks are blocked. Manual connection attempts - When the computer is already connected to either a non-domain based network or a domain based network over media other than Ethernet, and a user attempts to create a manual connection to an additional network in violation of this policy setting, the existing network connection is disconnected and the manual connection is allowed. - When the computer is already connected to either a non-domain based network or a domain based network over Ethernet, and a user attempts to create a manual connection to an additional network in violation of this policy setting, the existing Ethernet connection is maintained and the manual connection attempt is blocked.

Vulnerability Details

This policy setting prevents computers from connecting to both a domain based network and a non-domain based network at the same time. The recommended state for this setting is: Enabled.

Rationale: The potential concern is that a user would unknowingly allow network traffic to flow between the insecure public network and the managed corporate network.

Compliance: Ensure 'Prohibit installation and configuration of Network Bridge on your DNS domain network' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled : Computer Configuration\Policies\Administrative Templates\Network\Network Connections\Prohibit installation and configuration of Network Bridge on your DNS domain network Impact: The Network Bridge setting, if enabled, allows users to create a Layer 2 Media Access Control (MAC) bridge, enabling them to connect two or more physical network segments together. A network bridge thus allows a computer that has connections to two different networks to share data between those networks. In an enterprise environment, where there is a need to control network traffic to only authorized paths, you can disable the Network Bridge setting on a computer. If you disable Network Bridge on a computer, users cannot create or configure a network bridge. Membership in the local Administrators group, or equivalent, is the minimum required to complete this procedure.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

You can use this procedure to enable or disable the user's ability to install and configure a network bridge. The recommended state for this setting is: Enabled.

Rationale: Allowing users to create a network bridge increases the risk and attack surface from the bridged network.

CCE Reference Number: CCE-38002-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.4.10.2

Compliance: Ensure 'Replace a process level token' is set to 'LOCAL SERVICE, NETWORK SERVICE'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to LOCAL SERVICE, NETWORK SERVICE : Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Replace a process level token Impact: On most computers, this is the default configuration and there will be no negative impact. However, if you have installed the Web Server (IIS) Role with Web Services Role Service, you will need to allow the IIS application pool(s) to be granted this User Right Assignment.

Vulnerability Details

This policy setting allows one process or service to start another service or process with a different security access token, which can be used to modify the security access token of that sub-process and result in the escalation of privileges. The recommended state for this setting is: LOCAL SERVICE, NETWORK SERVICE.

Note: A server that holds the Web Server (IIS) Role with Web Server Role Service will require a special exception to this recommendation, to allow IIS application pool(s) to be granted this user right.

Rationale: User with the Replace a process level token privilege are able to start processes as other users whose credentials they know. They could use this method to hide their unauthorized actions on the computer. (On Windows 2000-based computers, use of the Replace a process level token user right also requires the user to have the Adjust memory quotas for a process user right that is discussed earlier in this section.)

CCE Reference Number: CCE-37430-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.36

Compliance: Ensure 'Require domain users to elevate when setting a network's location' is set to 'Enabled'	Trivial

Vulnerability Details

This policy setting determines whether to require domain users to elevate when setting a network's location. The recommended state for this setting is: Enabled.

Rationale: Allowing regular users to set a network location increases the risk and attack surface.

CCE Reference Number: CCE-38188-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.4.10.3

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Network\Network Connections\Require domain users to elevate when setting a network's location Impact: If you enable this policy setting domain users must elevate when setting a network's location. If you disable or do not configure this policy setting domain users can set a network's location without elevating.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Ensure 'Require pin for pairing' is set to 'Enabled' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Connect\Require pin for pairing

Note: This Group Policy path does not exist by default. An updated Group Policy template (WirelessDisplay.admx/adml) is required - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer).

Impact: The pairing ceremony for connecting to new wireless display devices will always require a PIN.

Vulnerability Details

This policy setting controls whether or not a PIN is required for pairing to a wireless display device. The recommended state for this setting is: Enabled.

Rationale: If this setting is not configured or disabled then a PIN would not be required when pairing wireless display devices to the system, increasing the risk of unauthorized use.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.14.1

Compliance: Ensure 'Require secure RPC communication' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Security\Require secure RPC communication Impact: If you enable this policy setting, the terminal server accepts requests from RPC clients that support secure requests, and does not allow unsecured communication with untrusted clients.

Vulnerability Details

This policy setting allows you to specify whether a terminal server requires secure remote procedure call (RPC) communication with all clients or allows unsecured communication. You can use this policy setting to strengthen the security of RPC communication with clients by allowing only authenticated and encrypted requests. The recommended state for this setting is: Enabled.

Rationale: Allowing unsecure RPC communication can exposes the server to man in the middle attacks and data disclosure attacks.

CCE Reference Number: CCE-37567-5
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.48.3.9.2

False Positive Notes

Compliance: Ensure 'Reset account lockout counter after' is set to '15 or more minute(s)' | Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to 15 or more minute(s): Computer Configuration\Policies\Windows Settings\Security Settings\Account Policies\Account Lockout Policy\Reset account lockout counter after Impact: If you do not configure this policy setting or if the value is configured to an interval that is too long, a DoS attack could occur. An attacker could maliciously attempt to log on to each user's account numerous times and lock out their accounts as described in the preceding paragraphs. If you do not configure the Reset account lockout counter after setting, administrators would have to manually unlock all accounts. If you configure this policy setting to a reasonable value the users would be locked out for some period, after which their accounts would unlock automatically. Be sure that you notify users of the values used for this policy setting so that they will wait for the lockout timer to expire before they call the help desk about their inability to log on.

Vulnerability Details

This policy setting determines the length of time before the Account lockout threshold resets to zero. The default value for this policy setting is Not Defined. If the Account lockout threshold is defined, this reset time must be less than or equal to the value for the Account lockout duration setting. If you leave this policy setting at its default value or configure the value to an interval that is too long, your environment could be vulnerable to a DoS attack. An attacker could maliciously perform a number of failed logon attempts on all users in the organization, which will lock out their accounts. If no policy were determined to reset the account lockout, it would be a manual task for administrators. Conversely, if a reasonable time value is configured for this policy setting, users would be locked out for a set period until all of the accounts are unlocked automatically. The recommended state for this setting is: 15 or more minute(s).

Rationale: Users can accidentally lock themselves out of their accounts if they mistype their password multiple times. To reduce the chance of such accidental lockouts, the Reset account lockout counter after setting determines the number of minutes that must elapse before the counter that tracks failed logon attempts and triggers lockouts is reset to 0.

CCE Reference Number: CCE-36883-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 1.2.3

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Restore files and directories' is set to 'Administrators'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Restore files and directories Impact: If you remove the Restore files and directories user right from the Backup Operators group and other accounts you could make it impossible for users who have been delegated specific tasks to perform those tasks. You should verify that this change won't negatively affect the ability of your organization's personnel to do their jobs.

Vulnerability Details

This policy setting determines which users can bypass file, directory, registry, and other persistent object permissions when restoring backed up files and directories on computers that run Windows Vista in your environment. This user right also determines which users can set valid security principals as object owners; it is similar to the Back up files and directories user right. The recommended state for this setting is: Administrators.

Rationale: An attacker with the Restore files and directories user right could restore sensitive data to a computer and overwrite data that is more recent, which could lead to loss of important data, data corruption, or a denial of service. Attackers could overwrite executable files that are used by legitimate administrators or system services with versions that include malicious software to grant themselves elevated privileges, compromise data, or install backdoors for continued access to the computer.

Note: Even if the following countermeasure is configured, an attacker could still restore data to a computer in a domain that is controlled by the attacker. Therefore, it is critical that organizations carefully protect the media that are used to back up data.

CCE Reference Number: CCE-37613-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.37

Compliance: Ensure 'Restrict Remote Desktop Services users to a single Remote Desktop Services session' is set to 'Enabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Connections\Restrict Remote Desktop Services users to a single Remote Desktop Services session>

Impact: None - this is the default configuration.

Vulnerability Details

This policy setting allows you to restrict users to a single Remote Desktop Services session. The recommended state for this setting is: Enabled.

Rationale: This setting ensures that users & administrators who Remote Desktop to a server will continue to use the same session - if they disconnect and reconnect, they will go back to the same session they were using before, preventing the creation of a second simultaneous session. This both prevents unnecessary resource usage by having the server host unnecessary additional sessions (which would put extra load on the server) and also ensures a consistency of experience for the user.

CCE Reference Number: CCE-37708-5

Compliance: Ensure 'Restrict Unauthenticated RPC clients' is set to 'Enabled: Authenticated' (MS only)

Trivial

Vulnerability Details

This policy setting controls how the RPC server runtime handles unauthenticated RPC clients connecting to RPC servers. This policy setting impacts all RPC applications. In a domain environment this policy setting should be used with caution as it can impact a wide range of functionality including group policy processing itself. Reverting a change to this policy setting can require manual intervention on each affected machine. This policy setting should never be applied to a domain controller. A client will be considered an authenticated client if it uses a named pipe to communicate with the server or if it uses RPC Security. RPC Interfaces that have specifically requested to be accessible by unauthenticated clients may be exempt from this restriction, depending on the selected value for this policy setting. -- "None" allows all RPC clients to connect to RPC Servers running on the machine on which the policy setting is applied. -- "Authenticated" allows only authenticated RPC Clients (per the definition above) to connect to RPC Servers running on the machine on which the policy setting is applied. Exemptions are granted to interfaces that have requested them. -- "Authenticated without exceptions" allows only authenticated RPC Clients (per the definition above) to connect to RPC Servers running on the machine on which the policy setting is applied. No exceptions are allowed. This value has the potential to cause serious problems and is not recommended. Note: This policy setting will not be applied until the system is rebooted. The recommended state for this setting is: Enabled: Authenticated.

Rationale: Unauthenticated RPC communication can create a security vulnerability.

CCE Reference Number: CCE-36559-3
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.32.2

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Authenticated:

<Computer Configuration\Policies\Administrative Templates\System\Remote Procedure Call\Restrict Unauthenticated RPC clients>

Impact: Only authenticated RPC Clients will be allowed to connect to RPC servers running on the machine on which the policy setting is applied. Exemptions are granted to interfaces that have requested them.

Compliance: Ensure 'Screen saver timeout' is set to 'Enabled: 900 seconds or fewer, but not 0'

Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: 900 or fewer, but not 0: User Configuration\Policies\Administrative Templates\Control Panel\Personalization\Screen saver timeout Impact: The screen saver will automatically activate when the computer has been unattended for the amount of time specified. The impact should be minimal since the screen saver is enabled by default.

Vulnerability Details

If the Screen Saver Timeout setting is enabled, then the screen saver will be launched when the specified amount of time has passed since the last user action. Valid values range from 1 to 89,400 seconds (24 hours). The setting has no effect if the wait time is set to zero or no screen saver has been specified. The recommended state for this setting is: Enabled: 900 seconds or fewer, but not 0.

Rationale: If a user forgets to lock their computer when they walk away it is possible that a passerby will hijack it.

Compliance: Ensure 'Security: Control Event Log behavior when the log file reaches its maximum size' is set to 'Disabled'

Trivial

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Event Log Service\Security\Control Event Log behavior when the log file reaches its maximum size Impact: If you enable this policy setting and a log file reaches its maximum size, new events are not written to the log and are lost. If you disable or do not configure this policy setting and a log file reaches its maximum size, new events overwrite old events.

Vulnerability Details

This policy setting controls Event Log behavior when the log file reaches its maximum size. If you enable this policy setting and a log file reaches its maximum size, new events are not written to the log and are lost. If you disable or do not configure this policy setting and a log file reaches its maximum size, new events overwrite old events.The recommended state for this setting is: Disabled.

Note: Old events may or may not be retained according to the "Backup log automatically when full" policy setting.

Rationale: If new events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users.

CCE Reference Number: CCE-37145-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.24.2.1

Compliance: Ensure 'Security: Specify the maximum log file size (KB)' is set to 'Enabled: 196,608 or greater'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Enabled: 196,608 or greater: Computer Configuration\Policies\Administrative Templates\Windows Components\Event Log Service\Security\Specify the maximum log file size (KB) Impact: When event logs fill to capacity, they will stop recording information unless the retention method for each is set so that the computer will overwrite the oldest entries with the most recent ones. To mitigate the risk of loss of recent data, you can configure the retention method so that older events are overwritten as needed. The consequence of this configuration is that older events will be removed from the logs. Attackers can take advantage of such a configuration, because they can generate a large number of extraneous events to overwrite any evidence of their attack. These risks can be somewhat reduced if you automate the archival and backup of event log data. Ideally, all specifically monitored events should be sent to a server that uses Microsoft System Center Operations Manager (SCOM) or some other automated monitoring tool. Such a configuration is particularly important because an attacker who successfully compromises a server could clear the Security log. If all events are sent to a monitoring server, then you will be able to gather forensic information about the attacker's activities.

Vulnerability Details

This policy setting specifies the maximum size of the log file in kilobytes. If you enable this policy setting, you can configure the maximum log file size to be between 1 megabyte (1,024 kilobytes) and 2 terabytes (2,147,483,647 kilobytes) in kilobyte increments. If you disable or do not configure this policy setting, the maximum size of the log file will be set to the locally configured value. This value can be changed by the local administrator using the Log Properties dialog and it defaults to 20 megabytes. The recommended state for this setting is: Enabled: 196,608 or greater.

Rationale: If events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users.

CCE Reference Number: CCE-37695-4

Compliance: Ensure 'Select when Feature Updates are received' is set to 'Enabled: Current Branch for Business, 180 days' — Trivial

Vulnerability Details

This policy setting determines what type of feature updates to receive, and when. The branch readiness level for each new Windows 10 feature update is initially considered a "Current Branch" (CB) release, to be used by organizations for initial deployments. Once Microsoft has verified the feature update should be considered for enterprise deployment, it will be declared a branch readiness level of "Current Branch for Business" (CBB). The recommended state for this setting is: Enabled: Current Branch for Business, 180 days.

Note: If the "Allow Telemetry" policy is set to 0, this policy will have no effect.

Rationale: Forcing new features without prior testing in your environment could cause software incompatibilities as well as introducing new bugs into the operating system. In a controlled corporate environment, it is generally preferred to delay the feature updates until thorough testing and a deployment plan is in place. This recommendation delays the automatic installation of new features as long as possible. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.90.1.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Current Branch for Business, 180 days: Computer Configuration\Policies\Administrative Templates\Windows

Components\Windows Update\Defer Windows Updates\Select when Feature Updates are received

Note: This Group Policy path does not exist by default. An updated Group Policy template (WindowsUpdate.admx/adml) is required - it is included with the Microsoft Windows 10 Release 1607 & Server 2016 Administrative Templates (or newer).

Impact: Feature Updates will be delayed until 180 days after they are declared to have a branch readiness level of "Current Branch for Business" (CBB).

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: High Level: Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Security\Set client connection encryption level Impact: Clients that do not support 128-bit encryption will be unable to establish Terminal Server sessions.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

There are no references for this vulnerability.

Compliance: Ensure 'Set client connection encryption level' is set to 'Enabled: High Level'

Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: High Level:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Security\Set client connection encryption level>

Impact: None - this is the default configuration.

Vulnerability Details

This policy setting specifies whether to require the use of a specific encryption level to secure communications between client computers and RD Session Host servers during Remote Desktop Protocol (RDP) connections. This policy only applies when you are using native RDP encryption. However, native RDP encryption (as opposed to SSL encryption) is not recommended. This policy does not apply to SSL encryption. The recommended state for this setting is: Enabled: High Level.

Rationale: If Terminal Server client connections are allowed that use low level encryption, it is more likely that an attacker will be able to decrypt any captured Terminal Services network traffic.

CCE Reference Number: CCE-36627-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.52.3.9.3

Compliance: Ensure 'Set the default behavior for AutoRun' is set to 'Enabled: Do not execute any autorun commands'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Do not execute any autorun commands: Computer Configuration\Policies\Administrative Templates\Windows Components\AutoPlay Policies\Set the default behavior for AutoRun Impact: If you enable this policy setting, an Administrator can change the default Windows Vista or later behavior for autorun to: a) Completely disable autorun commands, or b) Revert back to pre-Windows Vista behavior of automatically executing the autorun command.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting sets the default behavior for Autorun commands. Autorun commands are generally stored in autorun.inf files. They often launch the installation program or other routines. The recommended state for this setting is: Enabled: Do not execute any autorun commands.

Rationale: Prior to Windows Vista, when media containing an autorun command is inserted, the system will automatically execute the program without user intervention. This creates a major security concern as code may be executed without user's knowledge. The default behavior starting with Windows Vista is to prompt the user whether autorun command is to be run. The autorun command is represented as a handler in the Autoplay dialog.

CCE Reference Number: CCE-38217-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.8.2

Compliance: Ensure 'Set time limit for active but idle Remote Desktop Services sessions' is set to 'Enabled: 15 minutes or less'	Trivial

Vulnerability Details

This policy setting allows you to specify the maximum amount of time that an active Remote Desktop Services session can be idle (without user input) before it is automatically disconnected. The recommended state for this setting is: Enabled: 15 minutes or less.

Rationale: This setting helps to prevent active Remote Desktop sessions from tying up the computer for long periods of time while not in use, preventing computing resources from being consumed by large numbers of inactive sessions. In addition, old, forgotten Remote Desktops session that are still active can cause password lockouts if the user's password has changed but the old session is still running. For systems that limit the number of connected users (e.g. servers in the default Administrative mode - 2 sessions only), other users' old but still active sessions can prevent another user from connecting, resulting in an effective denial of service.

CCE Reference Number: CCE-37562-6
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.52.3.10.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: 15 minutes or less:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Session Time Limits\Set time limit for active but idle Remote Desktop Services sessions>

Impact: Remote Desktop Services will automatically disconnect active but idle sessions after 15 minutes (or the specified amount of time). The user receives a warning two minutes before the session disconnects, which allows the user to press a key or move the mouse to keep the session active. If you have a console session, idle session time limits do not apply.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Ensure 'Set time limit for disconnected sessions' is set to 'Enabled: 1 minute' | Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: 1 minute:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Session Time Limits\Set time limit for disconnected sessions>

Impact: Disconnected Remote Desktop sessions are deleted from the server after 1 minute. If you have a console session, disconnected session time limits do not apply.

Vulnerability Details

This policy setting allows you to configure a time limit for disconnected Remote Desktop Services sessions. The recommended state for this setting is: Enabled: 1 minute.

Rationale: This setting helps to prevent active Remote Desktop sessions from tying up the computer for long periods of time while not in use, preventing computing resources from being consumed by large numbers of disconnected but still active sessions. In addition, old, forgotten Remote Desktops session that are still active can cause password lockouts if the user's password has changed but the old session is still running. For systems that limit the number of connected users (e.g. servers in the default Administrative mode - 2 sessions only), other users' old but still active sessions can prevent another user from connecting, resulting in an effective denial of service. This setting is important to ensure a disconnected session is properly terminated.

Compliance: Ensure 'Setup: Control Event Log behavior when the log file reaches its maximum size' is set to 'Disabled' | Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Event Log

Service\Setup\Control Event Log behavior when the log file reaches its maximum size Impact: If you enable this policy setting and a log file reaches its maximum size, new events are not written to the log and are lost. If you disable or do not configure this policy setting and a log file reaches its maximum size, new events overwrite old events.

Vulnerability Details

This policy setting controls Event Log behavior when the log file reaches its maximum size. If you enable this policy setting and a log file reaches its maximum size, new events are not written to the log and are lost. If you disable or do not configure this policy setting and a log file reaches its maximum size, new events overwrite old events. The recommended state for this setting is: Disabled.

Note: Old events may or may not be retained according to the "Backup log automatically when full" policy setting.

Rationale: If new events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users.

CCE Reference Number: CCE-38276-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.24.3.1

Compliance: Ensure 'Setup: Specify the maximum log file size (KB)' is set to 'Enabled: 32,768 or greater'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Enabled: 32,768 or greater: Computer Configuration\Policies\Administrative Templates\Windows Components\Event Log Service\Setup\Specify the maximum log file size (KB) Impact: When event logs fill to capacity, they will stop recording information unless the retention method for each is set so that the computer will overwrite the oldest entries with the most recent ones. To mitigate the risk of loss of recent data, you can configure the retention method so that older events are overwritten as needed. The consequence of this configuration is that older events will be removed from the logs. Attackers can take advantage of such a configuration, because they can generate a large number of extraneous events to overwrite any evidence of their attack. These risks can be somewhat reduced if you automate the archival and backup of event log data. Ideally, all specifically monitored events should be sent to a server that uses Microsoft System Center Operations Manager (SCOM) or some other automated monitoring tool. Such a configuration is particularly important because an attacker who successfully compromises a server could clear the Security log. If all events are sent to a monitoring server, then you will be able to gather forensic information about the attacker's activities.

Vulnerability Details

This policy setting specifies the maximum size of the log file in kilobytes. If you enable this policy setting, you can configure the maximum log file size to be between 1 megabyte (1,024 kilobytes) and 2 terabytes (2,147,483,647 kilobytes) in kilobyte increments. If you disable or do not configure this policy setting, the maximum size of the log file will be set to the locally configured value. This value can be changed by the local administrator using the Log Properties dialog and it defaults to 20 megabytes. The recommended state for this setting is: Enabled: 32,768 or greater.

Rationale: If events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users

CCE Reference Number: CCE-37526-1

Compliance: Ensure 'Shutdown: Allow system to be shut down without having to log on' is set to 'Disabled'

Trivial

Vulnerability Details

This policy setting determines whether a computer can be shut down when a user is not logged on. If this policy setting is enabled, the shutdown command is available on the Windows logon screen. It is recommended to disable this policy setting to restrict the ability to shut down the computer to users with credentials on the system. The recommended state for this setting is: Disabled.

Rationale: Users who can access the console locally could shut down the computer.Attackers could also walk to the local console and restart the server, which would cause a temporary DoS condition. Attackers could also shut down the server and leave all of its applications and services unavailable.

CCE Reference Number: CCE-36788-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.13.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Shutdown: Allow system to be shut down without having to log on Impact: Operators will have to log on to servers to shut them down or restart them.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

Compliance: Ensure 'Shutdown: Allow system to be shut down without having to log on' is set to 'Disabled'

Trivial

Vulnerability Details

This policy setting determines whether a computer can be shut down when a user is not logged on. If this policy setting is enabled, the shutdown command is available on the Windows logon screen. It is recommended to disable this policy setting to restrict the ability to shut down the computer to users with credentials on the system. The recommended state for this setting is: Disabled.

Note: In Server 2008 R2 and older versions, this setting had no impact on Remote Desktop (RDP) / Terminal Services sessions - it only affected the local console. However, Microsoft changed the behavior in Windows Server 2012 (non-R2) and above, where if set to Enabled, RDP sessions are also allowed to shut down or restart the server.

Rationale: Users who can access the console locally could shut down the computer. Attackers could also walk to the local console and restart the server, which would cause a temporary DoS condition. Attackers could also shut down the server and leave all of its applications and services unavailable. As noted in the Description above, the Denial of Service (DoS) risk of enabling this setting dramatically increases in Windows Server 2012 (non-R2) and above, as even remote users can shut down or restart the server.

CCE Reference Number: CCE-36788-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.13.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\Shutdown: Allow system to be shut down without having to log on>

Impact: None - this is the default configuration.

Compliance: Ensure 'Shut down the system' is set to 'Administrators'

Trivial

Vulnerability Details

This policy setting determines which users who are logged on locally to the computers in your environment can shut down the operating system with the Shut Down command. Misuse of this user right can result in a denial of service condition. The recommended state for this setting is: Administrators.

Rationale: The ability to shut down domain controllers and member servers should be limited to a very small number of trusted administrators. Although the Shut down the system user right requires the ability to log on to the server, you should be very careful about which accounts and groups you allow to shut down a domain controller or member server. When a domain controller is shut down, it is no longer available to process logons, serve Group Policy, and answer Lightweight Directory Access Protocol (LDAP) queries. If you shut down domain controllers that possess Flexible Single Master Operations (FSMO) roles, you can disable key domain functionality, such as processing logons for new passwords#x2014;the Primary Domain Controller (PDC) Emulator role.

CCE Reference Number: CCE-38328-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.38

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Shut down the system Impact: The impact of removing these default groups from the Shut down the system user right could limit the delegated abilities of assigned roles in your environment. You should confirm that delegated activities will not be adversely affected.

Compliance: Ensure 'Sign-in last interactive user automatically after a system-initiated restart' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Windows Logon Options\Sign-in last interactive user automatically after a system-initiated restart >

Impact: The user is required to present the logon credentials in order to proceed after restart.

Vulnerability Details

This policy setting controls whether a device will automatically sign-in the last interactive user after Windows Update restarts the system. If you enable or do not configure this policy setting the device securely saves the user's credentials (including the user name domain and encrypted password) to configure automatic sign-in after a Windows Update restart. After the Windows Update restart the user is automatically signed-in and the session is automatically locked with all the lock screen apps configured for that user. If you disable this policy setting the device does not store the user's credentials for automatic sign-in after a Windows Update restart. The users' lock screen apps are not restarted after the system restarts. The recommended state for this setting is: Disabled.

Rationale: Disabling this feature will prevent the caching of user's credentials and unauthorized use of the device, and also ensure the user is aware of the restart.

CCE Reference Number: CCE-36977-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.70.1

Compliance: Ensure 'Support device authentication using certificate' is set to 'Enabled: Automatic'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Automatic:

<Computer Configuration\Policies\Administrative Templates\System\Kerberos\Support device authentication using certificate>

Impact: None - this is the default configuration.

Vulnerability Details

This policy setting allows you to set support for Kerberos to attempt authentication using the certificate for the device to the domain. Support for device authentication using certificate will require connectivity to a DC in the device account domain which supports certificate authentication for computer accounts. The recommended state for this setting is: Enabled: Automatic.

Rationale: Having stronger device authentication with the use of certificates is strongly encouraged over standard username and password authentication. Having this set to Automatic will allow certificate based authentication to be used whenever possible.

Compliance: Ensure 'Synchronize directory service data' is set to 'No One' (DC only) — Trivial

Vulnerability Details

This security setting determines which users and groups have the authority to synchronize all directory service data. The recommended state for this setting is: No One.

Rationale: The Synchronize directory service data user right affects domain controllers; only domain controllers should be able to synchronize directory service data. Domain controllers have this user right inherently, because the synchronization process runs in the context of the System account on domain controllers. Attackers who have this user right can view all information stored within the directory. They could then use some of that information to facilitate additional attacks or expose sensitive data, such as direct telephone numbers or physical addresses.

CCE Reference Number: CCE-36099-0
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.2.39

Solution Details

To establish the recommended configuration via GP, set the following UI path to No One:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Synchronize directory service data>

Impact: None - this is the default configuration.

False Positive Notes

Compliance: Ensure 'System ASLR' is set to 'Enabled: Application Opt-In'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Application Opt-In: Computer Configuration\Policies\Administrative Templates\Windows Components\EMET\System ASLR

Note: This Group Policy path does not exist by default. An additional Group Policy template (EMET.admx/adml) is required - it is included with Microsoft Enhanced Mitigation Experience Toolkit (EMET).

Vulnerability Details

This setting determines how applications become enrolled in address space layout randomization (ASLR). The recommended state for this setting is: Enabled: Application Opt-In.

Rationale: ASLR reduces the predictability of process memory, which in-turn helps reduce the reliability of exploits targeting memory corruption vulnerabilities.

CCE Reference Number: CCE-38437-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.22.6

False Positive Notes

Compliance: Ensure 'System: Control Event Log behavior when the log file reaches its maximum size' is set to 'Disabled'

Trivial

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Event Log Service\System\Control Event Log behavior when the log file reaches its maximum size Impact: If you enable this policy setting and a log file reaches its maximum size, new events are not written to the log and are lost. If you disable or do not configure this policy setting and a log file reaches its maximum size, new events overwrite old events.

Vulnerability Details

This policy setting controls Event Log behavior when the log file reaches its maximum size. If you enable this policy setting and a log file reaches its maximum size, new events are not written to the log and are lost. If you disable or do not configure this policy setting and a log file reaches its maximum size, new events overwrite old events. The recommended state for this setting is: Disabled.

Note: Old events may or may not be retained according to the "Backup log automatically when full" policy setting.

Rationale: If new events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users.

CCE Reference Number: CCE-36160-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.24.4.1

Compliance: Ensure 'System DEP' is set to 'Enabled: Application Opt-Out'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Application Opt-Out: Computer Configuration\Policies\Administrative Templates\Windows Components\EMET\System DEP

Note: This Group Policy path does not exist by default. An additional Group Policy template (EMET.admx/adml) is required - it is included with Microsoft Enhanced Mitigation Experience Toolkit (EMET).

Vulnerability Details

This setting determines how applications become enrolled in data execution protection (DEP). The recommended state for this setting is: Enabled: Application Opt-Out.

Rationale: DEP marks pages of application memory as non-executable, which reduces a given exploit's ability to run attacker-controlled code.

CCE Reference Number: CCE-38438-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.22.7

Compliance: Ensure 'System objects: Require case insensitivity for non-Windows subsystems' is set to 'Enabled'

Trivial

Vulnerability Details

This policy setting determines whether case insensitivity is enforced for all subsystems. The Microsoft Win32' subsystem is case insensitive. However, the kernel supports case sensitivity for other subsystems, such as the Portable Operating System Interface for UNIX (POSIX). Because Windows is case insensitive (but the POSIX subsystem will support case sensitivity), failure to enforce this policy setting makes it possible for a user of the POSIX subsystem to create a file with the same name as another file by using mixed case to label it. Such a situation can block access to these files by another user who uses typical Win32 tools, because only one of the files will be available. The recommended state for this setting is: Enabled.

Rationale: Because Windows is case-insensitive but the POSIX subsystem will support case sensitivity, failure to enable this policy setting would make it possible for a user of that subsystem to create a file with the same name as another file but with a different mix of upper and lower case letters. Such a situation could potentially confuse users when they try to access such files from normal Win32 tools because only one of the files will be available.

CCE Reference Number: CCE-37885-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.15.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\System objects: Require case insensitivity for non-Windows subsystems Impact: All subsystems will be forced to observe case insensitivity. This configuration may confuse users who are familiar with any UNIX-based operating systems that is case-sensitive.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'System objects: Strengthen default permissions of internal system objects (e.g. Symbolic Links)' is set to 'Enabled' | Trivial

Vulnerability Details

This policy setting determines the strength of the default discretionary access control list (DACL) for objects. The setting helps secure objects that can be located and shared among processes and its default configuration strengthens the DACL, because it allows users who are not administrators to read shared objects but does not allow them to modify any that they did not create. The recommended state for this setting is: Enabled.

Rationale: This setting determines the strength of the default DACL for objects. Windows Server 2003 maintains a global list of shared computer resources so that objects can be located and shared among processes. Each type of object is created with a default DACL that specifies who can access the objects and with what permissions. If you enable this setting, the default DACL is strengthened because non-administrator users are allowed to read shared objects but not modify shared objects that they did not create.

CCE Reference Number: CCE-37644-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.15.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\System objects: Strengthen default permissions of internal system objects (e.g. Symbolic Links) Impact: None. This is the default configuration.

CVSS Base Score: 0

Compliance: Ensure 'System objects: Strengthen default permissions of internal system objects (e.g. Symbolic Links)' is set to 'Enabled' | Trivial

Vulnerability Details

This policy setting determines the strength of the default discretionary access control list (DACL) for objects. Active Directory maintains a global list of shared system resources, such as DOS device names, mutexes, and semaphores. In this way, objects can be located and shared among processes. Each type of object is created with a default DACL that specifies who can access the objects and what permissions are granted. The recommended state for this setting is: Enabled.

Rationale: This setting determines the strength of the default DACL for objects. Windows maintains a global list of shared computer resources so that objects can be located and shared among processes. Each type of object is created with a default DACL that specifies who can access the objects and with what permissions.

CCE Reference Number: CCE-37644-2
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.15.2

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\System objects: Strengthen default permissions of internal system objects (e.g. Symbolic Links)>

Impact: None - this is the default configuration.

Compliance: Ensure 'System SEHOP' is set to 'Enabled: Application Opt-Out' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Application Opt-Out: Computer Configuration\Policies\Administrative Templates\Windows Components\EMET\System SEHOP

Note: This Group Policy path does not exist by default. An additional Group Policy template (EMET.admx/adml) is required - it is included with Microsoft Enhanced Mitigation Experience Toolkit (EMET).

Vulnerability Details

This setting determines how applications become enrolled in structured exception handler overwrite protection (SEHOP). The recommended state for this setting is: Enabled: Application Opt-Out.

Rationale: When a software component suffers from a memory corruption vulnerability, an exploit may be able to overwrite memory that contains data structures that control how the software handles exceptions. By corrupting these structures in a controlled manner, an exploit may be able to execute arbitrary code. SEHOP verifies the integrity of those structures before they are used to handle exceptions, which reduces the reliability of exploits that leverage structured exception handler overwrites.

CCE Reference Number: CCE-38439-6

Compliance: Ensure 'System: Specify the maximum log file size (KB)' is set to 'Enabled: 32,768 or greater' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Enabled: 32,768 or greater: Computer Configuration\Policies\Administrative Templates\Windows Components\Event Log Service\System\Specify the maximum log file size (KB) Impact: When event logs fill to capacity, they will stop recording information unless the retention method for each is set so that the computer will overwrite the oldest entries with the most recent ones. To mitigate the risk of loss of recent data, you can configure the retention method so that older events are overwritten as needed. The consequence of this configuration is that older events will be removed from the logs. Attackers can take advantage of such a configuration, because they can generate a large number of extraneous events to overwrite any evidence of their attack. These risks can be somewhat reduced if you automate the archival and backup of event log data. Ideally, all specifically monitored events should be sent to a server that uses Microsoft System Center Operations Manager (SCOM) or some other automated monitoring tool. Such a configuration is particularly important because an attacker who successfully compromises a server could clear the Security log. If all events are sent to a monitoring server, then you will be able to gather forensic information about the attacker's activities.

Vulnerability Details

This policy setting specifies the maximum size of the log file in kilobytes. If you enable this policy setting, you can configure the maximum log file size to be between 1 megabyte (1,024 kilobytes) and 2 terabytes (2,147,483,647 kilobytes) in kilobyte increments. If you disable or do not configure this policy setting, the maximum size of the log file will be set to the locally configured value. This value can be changed by the local administrator using the Log Properties dialog and it defaults to 20 megabytes. The recommended state for this setting is: Enabled: 32,768 or greater.

Rationale: If events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users

CCE Reference Number: CCE-36092-5
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.24.4.2

Compliance: Ensure 'Take ownership of files or other objects' is set to 'Administrators' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Administrators: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\User Rights Assignment\Take ownership of files or other objects Impact: None. This is the default configuration.

Vulnerability Details

This policy setting allows users to take ownership of files, folders, registry keys, processes, or threads. This user right bypasses any permissions that are in place to protect objects to give ownership to the specified user. The recommended state for this setting is: Administrators.

Rationale: Any users with the Take ownership of files or other objects user right can take control of any object, regardless of the permissions on that object, and then make any changes they wish to that object. Such changes could result in exposure of data, corruption of data, or a DoS condition.

CCE Reference Number: CCE-38325-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.2.40

Compliance: Ensure 'Toggle user control over Insider builds' is set to 'Disabled' — Trivial

Vulnerability Details

This policy setting determines whether users can access the Insider build controls in the Advanced Options for Windows Update. These controls are located under "Get Insider builds," and enable users to make their devices available for downloading and installing Windows preview software. The recommended state for this setting is: Disabled.

Note: This policy setting applies only to devices running Windows 10 Pro, Windows 10 Enterprise, or Server 2016.

Rationale: It can be dangerous in an Enterprise environment if experimental features are allowed because this can introduce bugs and security holes into systems allowing an attacker to gain access.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.16.4

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Data Collection and Preview Builds\Toggle user control over Insider builds

Note: This Group Policy path does not exist by default. An additional Group Policy template (allowbuildpreview.admx/adml) is required - it is included with the Microsoft Windows 10 Administrative Templates.

Impact: The item "Get Insider builds" will be unavailable.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Turn off access to the Store' is set to 'Enabled' Trivial

Vulnerability Details

This policy setting specifies whether to use the Store service for finding an application to open a file with an unhandled file type or protocol association. When a user opens a file type or protocol that is not associated with any applications on the computer, the user is given the choice to select a local application or use the Store service to find an application. The recommended state for this setting is: Enabled.

Rationale: The Store service is a retail outlet built into Windows, primarily for consumer use. In an enterprise environment the IT department should be managing the installation of all applications to reduce the risk of the installation of vulnerable software.

CCE Reference Number: CCE-37904-0
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.1

False Positive Notes

Compliance: Ensure 'Turn off Autoplay' is set to 'Enabled: All drives' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: All drives:

Computer Configuration\Policies\Administrative Templates\Windows Components\AutoPlay Policies\Turn off Autoplay Impact: Users will have to manually launch setup or installation programs that are provided on removable media.

Vulnerability Details

Autoplay starts to read from a drive as soon as you insert media in the drive, which causes the setup file for programs or audio media to start immediately. An attacker could use this feature to launch a program to damage the computer or data on the computer. You can enable the Turn off Autoplay setting to disable the Autoplay feature. Autoplay is disabled by default on some removable drive types, such as floppy disk and network drives, but not on CD-ROM drives.

Note: You cannot use this policy setting to enable Autoplay on computer drives in which it is disabled by default, such as floppy disk and network drives. The recommended state for this setting is: Enabled: All drives.

Rationale: An attacker could use this feature to launch a program to damage a client computer or data on the computer.

CCE Reference Number: CCE-36875-3

Compliance: Ensure 'Turn off background refresh of Group Policy' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\System\Group Policy\Turn off background refresh of Group Policy Impact: None - this is the default behavior. If you enable this policy setting the system waits until the current user logs off the system before updating the computer and user settings. If you disable or do not configure this policy setting updates can be applied while users are working. The frequency of updates is determined by the "Set Group Policy refresh interval for computers" and "Set Group Policy refresh interval for users" policy settings.

Note: If you make changes to this policy setting you must restart your computer for it to take effect.

Vulnerability Details

This policy setting prevents Group Policy from being updated while the computer is in use. This policy setting applies to Group Policy for computers, users and domain controllers. The recommended state for this setting is: Disabled.

Rationale: Setting this option to false (unchecked) will ensure that group policy changes take effect more quickly, as compared to waiting until the next user logon or system restart.

CCE Reference Number: CCE-37712-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.8.18.4

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Turn off Data Execution Prevention for Explorer' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\File Explorer\Turn off Data Execution Prevention for Explorer Impact: Enabling this policy setting may allow certain legacy plug-in applications to function. Disabling this policy setting will ensure that Data Execution Prevention blocks certain types of malware from exploiting Explorer.

Vulnerability Details

Disabling data execution prevention can allow certain legacy plug-in applications to function without terminating Explorer. The recommended state for this setting is: Disabled.

Rationale: Data Execution Prevention is an important security feature supported by Explorer that helps to limit the impact of certain types of malware.

CCE Reference Number: CCE-37809-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.28.3

Compliance: Ensure 'Turn off downloading of print drivers over HTTP' is set to 'Enabled'

Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off downloading of print drivers over HTTP>

Impact: Print drivers cannot be downloaded over HTTP.

Note: This policy setting does not prevent the client computer from printing to printers on the intranet or the Internet over HTTP. It only prohibits downloading drivers that are not already installed locally.

Vulnerability Details

This policy setting controls whether the computer can download print driver packages over HTTP. To set up HTTP printing, printer drivers that are not available in the standard operating system installation might need to be downloaded over HTTP. The recommended state for this setting is: Enabled.

Rationale: Users might download drivers that include malicious code.

CCE Reference Number: CCE-36625-2

Compliance: Ensure 'Turn off handwriting personalization data sharing' is set to 'Enabled'

Trivial

Vulnerability Details

This setting turns off data sharing from the handwriting recognition personalization tool. The handwriting recognition personalization tool enables Tablet PC users to adapt handwriting recognition to their own writing style by providing writing samples. The tool can optionally share user writing samples with Microsoft to improve handwriting recognition in future versions of Windows. The tool generates reports and transmits them to Microsoft over a secure connection. The recommended state for this setting is: Enabled.

Rationale: A person's handwriting is Personally Identifiable Information (PII), especially when it comes to your signature. As such, it is unacceptable in many environments to automatically upload PII to a website without explicit approval by the user.

CCE Reference Number: CCE-37911-5
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.3

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off handwriting personalization data sharing

Note: This Group Policy setting is provided by the Group Policy template "ShapeCollector.admx/adml" that is included with the Microsoft Windows 7/2008R2, 8/2012, 8.1/2012R2 and Windows 10 Administrative Templates. Impact: Tablet PC users cannot choose to share writing samples from the handwriting recognition personalization tool with Microsoft.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

There are no references for this vulnerability.

Compliance: Ensure 'Turn off handwriting recognition error reporting' is set to 'Enabled'	Trivial

Vulnerability Details

Turns off the handwriting recognition error reporting tool. The handwriting recognition error reporting tool enables users to report errors encountered in Tablet PC Input Panel. The tool generates error reports and transmits them to Microsoft over a secure connection. Microsoft uses these error reports to improve handwriting recognition in future versions of Windows. The recommended state for this setting is: Enabled.

Rationale: A person's handwriting is Personally Identifiable Information (PII), especially when it comes to your signature. As such, it is unacceptable in many environments to automatically upload PII to a website without explicit approval by the user.

CCE Reference Number: CCE-36203-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.4

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off handwriting recognition error reporting>

Impact: Users cannot start the handwriting recognition error reporting tool or send error reports to Microsoft.

False Positive Notes

Compliance: Ensure 'Turn off heap termination on corruption' is set to 'Disabled'	Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Legacy plug-in applications may continue to function when a File Explorer session has become corrupt. Disabling this feature will prevent this. The recommended state for this setting is: Disabled.

Rationale: Allowing an application to function after its session has become corrupt increases the risk posture to the system.

CCE Reference Number: CCE-36660-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.28.4

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Disabled : Computer Configuration\Policies\Administrative Templates\Windows Components\File Explorer\Turn off heap termination on corruption Impact: Disabling heap termination on corruption can allow certain legacy plug-in applications to function without terminating Explorer immediately although Explorer may still terminate unexpectedly later.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Turn off heap termination on corruption' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Disabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\File Explorer\Turn off heap termination on corruption>

Impact: None - this is the default configuration.

Vulnerability Details

Without heap termination on corruption, legacy plug-in applications may continue to function when a File Explorer session has become corrupt. Ensuring that heap termination on corruption is active will prevent this. The recommended state for this setting is: Disabled.

Rationale: Allowing an application to function after its session has become corrupt increases the risk posture to the system.

CCE Reference Number: CCE-36660-9
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.30.4

Compliance: Ensure 'Turn off Internet Connection Wizard if URL connection is referring to Microsoft.com' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off Internet Connection Wizard if URL connection is referring to Microsoft.com>

Impact: The "Choose a list of Internet Service Providers" path in the Internet Connection Wizard causes the wizard to exit. This prevents users from retrieving the list of ISPs, which resides on Microsoft servers.

Vulnerability Details

This policy setting specifies whether the Internet Connection Wizard can connect to Microsoft to download a list of Internet Service Providers (ISPs). The recommended state for this setting is: Enabled.

Rationale: In an Enterprise environment we want to lower the risk of a user unknowingly exposing sensitive data.

CCE Reference Number: CCE-37163-3
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.5

False Positive Notes

Compliance: Ensure 'Turn off Internet download for Web publishing and online ordering wizards' is set to 'Enabled'

Trivial

Vulnerability Details

This policy setting controls whether Windows will download a list of providers for the Web publishing and online ordering wizards. The recommended state for this setting is: Enabled.

Rationale: Although the risk is minimal, enabling this setting will reduce the possibility of a user unknowingly downloading malicious content through this feature.

CCE Reference Number: CCE-36096-6
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.6

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off Internet download for Web publishing and online ordering wizards>

Impact: Windows is prevented from downloading providers; only the service providers cached in the local registry are displayed.

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

There are no references for this vulnerability.

Compliance: Ensure 'Turn off KMS Client Online AVS Validation' is set to 'Enabled'

Trivial

Vulnerability Details

The Key Management Service (KMS) is a Microsoft license activation method that entails setting up a local server that stores the licenses. The server itself needs to connect to Microsoft to activate the KMS service, but subsequent on-network clients can activate Microsoft Windows OS and/or their Microsoft

Office via the KMS server instead of connecting directly to Microsoft. This policy setting lets you opt-out of sending KMS client activation data to Microsoft automatically. The recommended state for this setting is: Enabled.

Rationale: Even though the KMS licensing method does not require a connection to Microsoft, the clients using KMS licensing still send KMS client activation state data to Microsoft automatically. Preventing this information from being sent can help reduce privacy concerns.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.59.1

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Software Protection Platform\Turn off KMS Client Online AVS Validation

Note: This Group Policy setting is provided by the Group Policy template "avsvalidationgp.admx/adml" that is included with the Microsoft Windows 10 Administrative Templates.

Impact: The computer is prevented from sending data to Microsoft regarding its KMS client activation state.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Turn off location' is set to 'Enabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Location and Sensors\Turn off location>

Impact: The location feature is turned off, and all programs on this computer are prevented from using location information from the location feature.

Vulnerability Details

This policy setting turns off the location feature for the computer. The recommended state for this setting is: Enabled.

Rationale: This setting affects the location feature (e.g. GPS or other location tracking). From a security perspective, it's not a good idea to reveal your location to software in most cases, but there are legitimate uses, such as mapping software.

CCE Reference Number: CCE-36886-0
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.37.2

False Positive Notes

Compliance: Ensure 'Turn off Microsoft consumer experiences' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Cloud Content\Turn off Microsoft consumer experiences>

Impact: Users will no longer see personalized recommendations from Microsoft and notifications about their Microsoft account.

Vulnerability Details

This policy setting turns off experiences that help consumers make the most of their devices and Microsoft account. The recommended state for this setting is: Enabled.

Note: Per Microsoft TechNet, this policy setting only applies to Windows 10 Enterprise and Windows 10 Education.

Rationale: Having apps silently installed in an environment is not good security practice - especially if the apps send data back to a 3rd party. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.13.1

False Positive Notes

Compliance: Ensure 'Turn off Microsoft Peer-to-Peer Networking Services' is set to 'Enabled'

Trivial

Vulnerability Details

The Peer Name Resolution Protocol (PNRP) allows for distributed resolution of a name to an IPV6 address and port number. The protocol operates in the context of clouds. A cloud is a set of peer computers that can communicate with each other by using the same IPv6 scope. Peer-to-Peer protocols allow for applications in the areas of RTC, collaboration, content distribution and distributed processing. The recommended state for this setting is: Enabled.

Rationale: This setting enhances the security of the environment and reduces the overall risk exposure related to peer-to-peer networking.

CCE Reference Number: CCE-37699-6
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.4.10.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Network\Microsoft Peer-to-Peer Networking Services\Turn off Microsoft Peer-to-Peer Networking Services>

Impact: Microsoft Peer-to-Peer Networking Services are turned off in their entirety, and all applications dependent on them will stop working.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

Compliance: Ensure 'Turn off multicast name resolution' is set to 'Enabled' (MS Only)

Trivial

Vulnerability Details

LLMNR is a secondary name resolution protocol. With LLMNR, queries are sent using multicast over a local network link on a single subnet from a client computer to another client computer on the same subnet that also has LLMNR enabled. LLMNR does not require a DNS server or DNS client configuration, and provides name resolution in scenarios in which conventional DNS name resolution is not possible. The recommended state for this setting is: Enabled.

Rationale: An attacker can listen on a network for these LLMNR (UDP/5355) or NBT-NS (UDP/137) broadcasts and respond to them, It can trick the host into thinking that it knows the location of the requested system.

Note: To completely mitigate local name resolution poisoning, in addition to this setting, the properties of each installed NIC should also be set to Disable NetBIOS over TCP/IP (on the WINS tab in the NIC properties). Unfortunately, there is no global setting to achieve this that automatically applies to all NICs - it is a per NIC setting that varies with different NIC hardware installations.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.4.4.2

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Network\DNS Client\Turn off multicast name resolution>

Impact: In the event DNS is unavailable a system will be unable to request it from other systems on the same subnet.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Turn off printing over HTTP' is set to 'Enabled' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off printing over HTTP>

Impact: The client computer will not be able to print to Internet printers over HTTP.

Note: This policy setting affects the client side of Internet printing only. Regardless of how it is configured, a computer could act as an Internet Printing server and make its shared printers available through HTTP.

Vulnerability Details

This policy setting allows you to disable the client computer's ability to print over HTTP, which allows the computer to print to printers on the intranet as well as the Internet. The recommended state for this setting is: Enabled.

Rationale: Information that is transmitted over HTTP through this capability is not protected and can be intercepted by malicious users. For this reason, it is not often used in enterprise environments.

CCE Reference Number: CCE-36920-7
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.7

Compliance: Ensure 'Turn off Search Companion content file updates' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off Search Companion content file updates>

Impact: Search Companion does not download content updates during searches.

Note: Internet searches will still send the search text and information about the search to Microsoft and the chosen search provider. If you select Classic Search, the Search Companion feature will be unavailable. You can select Classic Search by clicking Start, Search, Change Preferences, and then Change Internet Search Behavior.

Vulnerability Details

This policy setting specifies whether Search Companion should automatically download content updates during local and Internet searches. The recommended state for this setting is: Enabled.

Rationale: There is a small risk that users will unknowingly reveal sensitive information because of the topics they are searching for. This risk is very low because even if this setting is enabled users still must submit search queries to the desired search engine in order to perform searches.

CCE Reference Number: CCE-36884-5
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.9

Compliance: Ensure 'Turn off shell protocol protected mode' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\File Explorer\Turn off shell protocol protected mode Impact: If you enable this policy setting the protocol is fully enabled allowing the opening of folders and files. If you disable this policy setting the protocol is in the protected mode allowing applications to only open a limited set of folders.

Vulnerability Details

This policy setting allows you to configure the amount of functionality that the shell protocol can have. When using the full functionality of this protocol applications can open folders and launch files. The protected mode reduces the functionality of this protocol allowing applications to only open a limited set of folders. Applications are not able to open files with this protocol when it is in the protected mode. It is recommended to leave this protocol in the protected mode to increase the security of Windows. The recommended state for this setting is: Disabled.

Rationale: Limiting the opening of files and folders to a limited set reduces the attack surface of the system.

CCE Reference Number: CCE-36809-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.28.5

Compliance: Ensure 'Turn off the "Order Prints" picture task' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off the "Order Prints" picture task>

Impact: The task "Order Prints Online" is removed from Picture Tasks in File Explorer folders.

Vulnerability Details

This policy setting specifies whether the "Order Prints Online" task is available from Picture Tasks in

Windows folders. The Order Prints Online Wizard is used to download a list of providers and allow users to order prints online. The recommended state for this setting is: Enabled.

Rationale: In an Enterprise environment we want to lower the risk of a user unknowingly exposing sensitive data.

CCE Reference Number: CCE-38275-4
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.10

Compliance: Ensure 'Turn off the "Publish to Web" task for files and folders' is set to 'Enabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off the "Publish to Web" task for files and folders>

Impact: The "Publish to Web" task is removed from File and Folder tasks in Windows folders.

Vulnerability Details

This policy setting specifies whether the tasks Publish this file to the Web, Publish this folder to the Web, and Publish the selected items to the Web are available from File and Folder Tasks in Windows folders. The recommended state for this setting is: Enabled.

Rationale: Users may publish confidential or sensitive information to a public service outside of the control of the organization.

CCE Reference Number: CCE-37090-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.11

Compliance: Ensure 'Turn off the Store application' is set to 'Enabled' Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\Windows Components\Store\Turn off the Store application>

Impact: Access to the Windows Store application is denied.

Vulnerability Details

This setting denies or allows access to the Store application. The recommended state for this setting is: Enabled.

Rationale: Only applications approved by an IT department should be installed. Allowing users to install 3rd party applications can lead to missed patches and potential zero day vulnerabilities.

CCE Reference Number: CCE-38363-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.61.4

Compliance: Ensure 'Turn off the Windows Messenger Customer Experience Improvement Program' is set to 'Enabled' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off the Windows Messenger Customer Experience

Improvement Program>

Impact: Windows Messenger will not collect usage information, and the user settings to enable the collection of usage information will not be shown.

Vulnerability Details

This policy setting specifies whether Windows Messenger can collect anonymous information about how the Windows Messenger software and service is used. Microsoft uses information collected through the Customer Experience Improvement Program to detect software flaws so that they can be corrected more quickly, enabling this setting will reduce the amount of data Microsoft is able to gather for this purpose. The recommended state for this setting is: Enabled.

Rationale: Large enterprise environments may not want to have information collected from managed client computers.

CCE Reference Number: CCE-36628-6
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.20.1.12

Compliance: Ensure 'Turn off toast notifications on the lock screen' is set to 'Enabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: User Configuration\Policies\Administrative Templates\Start Menu and Taskbar\Notifications\Turn off toast notifications on the lock screen Impact: By turning off this feature, applications will not be able to raise toast notifications on the lock screen, and user will not be able to access the information.

Vulnerability Details

This policy setting turns off toast notifications on the lock screen. If you enable this policy setting, applications will not be able to raise toast notifications on the lock screen. If you disable or do not configure this policy setting, toast notifications on the lock screen are enabled and can be turned off by the administrator or user. No reboots or service restarts are required for this policy setting to take effect. The recommended state for this setting is Enabled.

Rationale: While this feature can be handy for users applications that provide toast notifications might display sensitive personal or business data while the device is unattended.

CCE Reference Number: CCE-36332-5

Compliance: Ensure 'Turn off Windows Error Reporting' is set to 'Enabled'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

<Computer Configuration\Policies\Administrative Templates\System\Internet Communication Management\Internet Communication settings\Turn off Windows Error Reporting>

Impact: Users are not given the option to report errors to Microsoft.

Vulnerability Details

This policy setting controls whether or not errors are reported to Microsoft. Error Reporting is used to report information about a system or application that has failed or has stopped responding and is used to improve the quality of the product. The recommended state for this setting is: Enabled.

Rationale: If a Windows Error occurs in a secure, managed corporate environment, the error should be reported directly to IT staff for troubleshooting and remediation. There is no benefit to the corporation to report these errors directly to Microsoft, and there is some risk of unknowingly exposing sensitive data as part of the error.

CCE Reference Number: CCE-35964-6

Compliance: Ensure 'Turn on convenience PIN sign-in' is set to 'Disabled'	Trivial

Vulnerability Details

This policy setting allows you to control whether a domain user can sign in using a convenience PIN. In Windows 10, convenience PIN was replaced with Passport, which has stronger security properties. To configure Passport for domain users, use the policies under Computer configuration\Administrative Templates\Windows Components\Microsoft Passport for Work. If you enable this policy setting, a domain user can set up and sign in with a convenience PIN. If you disable or don't configure this policy setting, a domain user can't set up and use a convenience PIN.

Note that the user's domain password will be cached in the system vault when using this feature. The recommended state for this setting is: Disabled.

Rationale: A PIN is created from a much smaller selection of characters than a password, so in most cases a PIN will be much less robust than a password.

CCE Reference Number: CCE-37528-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.8.24.5

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\System\Logon\Turn on convenience PIN sign-in Note: In older Microsoft Windows Administrative Templates, this setting was simply named "Turn on PIN sign-in", but it was renamed as of the Windows 10 R1511 Administrative Templates. Impact: None - this is the default behavior.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Turn on Mapper I/O (LLTDIO) driver' is set to 'Disabled'

Trivial

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to Disabled:

<Computer Configuration\Policies\Administrative Templates\Network\Link-Layer Topology Discovery\Turn on Mapper I/O (LLTDIO) driver>

Impact: None - this is the default configuration.

Vulnerability Details

This policy setting changes the operational behavior of the Mapper I/O network protocol driver. LLTDIO allows a computer to discover the topology of a network it's connected to. It also allows a computer to initiate Quality-of-Service requests such as bandwidth estimation and network health analysis. The recommended state for this setting is: Disabled.

Rationale: To help protect from potentially discovering and connecting to unauthorized devices, We are recommending that this setting be disabled to guarantee the prevention of responding to network traffic for network topology discovery.

CCE Reference Number: CCE-38170-7
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.4.9.1

Compliance: Ensure 'Turn on PowerShell Script Block Logging' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows PowerShell\Turn on PowerShell Script Block Logging

Note: This Group Policy path does not exist by default. A newer version of the "powershellexecutionpolicy.admx/adml" Administrative Template is required - it is included with the Microsoft Windows 10 Administrative Templates.

Impact: If you disable this policy setting, logging of PowerShell script input is disabled.

Vulnerability Details

This policy setting enables logging of all PowerShell script input to the Microsoft-Windows-PowerShell/Operational event log. The recommended state for this setting is: Disabled.

Rationale: Due to the potential risks of capturing passwords in the logs. This setting should only be needed for debugging purposes, and not in normal operation, it is important to ensure this is set to Disabled. CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.79.1

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Turn on PowerShell Script Block Logging' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Disabled: Computer Configuration\Policies\Administrative Templates\Windows Components\Windows PowerShell\Turn on PowerShell Script Block Logging

Note: This Group Policy path does not exist by default. A newer version of the "powershellexecutionpolicy.admx/adml" Administrative Template is required - it is included with the Microsoft Windows 10 Administrative Templates.

Impact: Logging of PowerShell script input is disabled.

Vulnerability Details

This policy setting enables logging of all PowerShell script input to the Microsoft-Windows-PowerShell/Operational event log. The recommended state for this setting is: Disabled.

Note: In Microsoft's own hardening guidance, they recommend the opposite value, Enabled, because having this data logged improves investigations of PowerShell attack incidents. However, the default ACL on the PowerShell Operational log allows Interactive User (i.e. any logged on user) to read it, and therefore possibly expose passwords or other sensitive information to unauthorized users. If Microsoft locks down the default ACL on that log in the future (e.g. to restrict it only to Administrators), then we will revisit this recommendation in a future release.

Rationale: There are potential risks of capturing passwords in the PowerShell logs. This setting should only be needed for debugging purposes, and not in normal operation, it is important to ensure this is set to Disabled. CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.9.84.1

False Positive Notes

Compliance: Ensure 'Turn on PowerShell Transcription' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following Group Policy setting to Disabled : Computer Configuration\Policies\Administrative Templates\Windows Components\Windows PowerShell\Turn on PowerShell Transcription

Note: This Group Policy path does not exist by default. A newer version of the "powershellexecutionpolicy.admx/adml" Administrative Template is required - it is included with the

Microsoft Windows 10 Administrative Templates. Impact: If you disable this policy setting, transcription of PowerShell-based applications is disabled by default, although transcription can still be enabled through the Start-Transcript cmdlet.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This Policy setting lets you capture the input and output of Windows PowerShell commands into text-based transcripts. The recommended state for this setting is: Disabled.

Rationale: If this setting is enabled there is a risk that passwords could get stored in plain text in the PowerShell_transcript output file.

CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.9.79.2

CVSS Base Score: 0

Compliance: Ensure 'Turn on Responder (RSPNDR) driver' is set to 'Disabled'	Trivial

Solution Details

To implement the recommended configuration state, set the following Group Policy setting to Disabled:

<Computer Configuration\Policies\Administrative Templates\Network\Link-Layer Topology Discovery\Turn on Responder (RSPNDR) driver>

Impact: None - this is the default configuration.

Vulnerability Details

This policy setting changes the operational behavior of the Responder network protocol driver. The Responder allows a computer to participate in Link Layer Topology Discovery requests so that it can be discovered and located on the network. It also allows a computer to participate in Quality-of-Service activities such as bandwidth estimation and network health analysis. The recommended state for this setting is: Disabled.

Rationale: To help protect from potentially discovering and connecting to unauthorized devices, We are recommending that this setting be disabled to guarantee the prevention of responding to network traffic for network topology discovery.

Compliance: Ensure 'Untrusted Font Blocking' is set to 'Enabled: Block untrusted fonts and log events'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Block untrusted fonts and log events:

<Computer Configuration\Policies\Administrative Templates\System\Mitigation Options\Untrusted Font Blocking>

Impact: Fonts not located in the %windir%\Fonts directory will not be loaded. This setting can temporarily be run in Audit mode ("Log events without blocking untrusted fonts") first to observe if blocking untrusted fonts would cause any usability or compatibility issues.

Vulnerability Details

This security feature provides a global setting to prevent programs from loading untrusted fonts. Untrusted fonts are any font installed outside of the %windir%\Fonts directory. This feature can be configured to be in 3 modes: On, Off, and Audit. The recommended state for this setting is: Enabled: Block untrusted fonts and log events

Rationale: Blocking untrusted fonts helps prevent both remote (web-based or email-based) and local EOP attacks that can happen during the font file-parsing process.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.8.26.1

Compliance: Ensure 'User Account Control: Admin Approval Mode for the Built-in Administrator account' is set to 'Enabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\User Account Control: Admin Approval Mode for the Built-in Administrator account Impact: Users that log on using the local Administrator account will be prompted for consent whenever a program requests an elevation in privilege.

Vulnerability Details

This policy setting controls the behavior of Admin Approval Mode for the built-in Administrator account. The options are:- Enabled: The built-in Administrator account uses Admin Approval Mode. By default, any operation that requires elevation of privilege will prompt the user to approve the operation.- Disabled: (Default) The built-in Administrator account runs all applications with full administrative privilege. The recommended state for this setting is: Enabled.

Rationale: One of the risks that the User Account Control feature introduced with Windows Vista is trying to mitigate is that of malicious software running under elevated credentials without the user or administrator being aware of its activity. An attack vector for these programs was to discover the password of the account named "Administrator" because that user account was created for all installations of Windows. To address this risk, in Windows Vista the built-in Administrator account is disabled. In a default installation of a new computer, accounts with administrative control over the computer are initially set up in one of two ways:- If the computer is not joined to a domain, the first user account you create has the equivalent permissions as a local administrator.- If the computer is joined to a domain, no local administrator accounts are created. The Enterprise or Domain Administrator must log on to the computer and create one if a local administrator account is warranted. Once Windows Vista is installed, the built-in Administrator account may be enabled, but we strongly recommend that this account remain disabled.

CCE Reference Number: CCE-36494-3

Compliance: Ensure 'User Account Control: Allow UIAccess applications to prompt for elevation without using the secure desktop' is set to 'Disabled'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\User Account Control: Allow UIAccess applications to prompt for elevation without using the secure desktop Impact: If you enable this setting, ("User Account Control: Allow UIAccess applications to prompt for elevation without using the secure desktop), requests for elevation are automatically sent to the interactive desktop (not the secure desktop) and also appear on the remote administrator's view of the desktop during a Windows Remote Assistance session, and the remote administrator is able to provide the appropriate credentials for elevation. This setting does not change the behavior of the UAC elevation prompt for administrators.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This policy setting controls whether User Interface Accessibility (UIAccess or UIA) programs can automatically disable the secure desktop for elevation prompts used by a standard user.- Enabled: UIA programs, including Windows Remote Assistance, automatically disable the secure desktop for elevation prompts. If you do not disable the "User Account Control: Switch to the secure desktop when prompting for elevation" policy setting, the prompts appear on the interactive user's desktop instead of the secure desktop.- Disabled: (Default) The secure desktop can be disabled only by the user of the interactive desktop or by disabling the "User Account Control: Switch to the secure desktop when prompting for elevation" policy setting. The recommended state for this setting is: Disabled.

Rationale: One of the risks that the UAC feature introduced with Windows Vista is trying to mitigate is that of malicious software running under elevated credentials without the user or administrator being aware of its activity. This setting allows the administrator to perform operations that require elevated privileges while connected via Remote Assistance. This increases security in that organizations can use UAC even when end user support is provided remotely. However, it also reduces security by adding the risk that an administrator might allow an unprivileged user to share elevated privileges for an application that the administrator needs to use during the Remote Desktop session.

Compliance: Ensure 'User Account Control: Behavior of the elevation prompt for administrators in Admin Approval Mode' is set to 'Prompt for consent on the secure desktop'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Prompt for consent on the secure desktop: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\User Account Control: Behavior of the elevation prompt for administrators in Admin Approval Mode Impact: This policy setting controls the behavior of the elevation prompt for administrators.

Vulnerability Details

This policy setting controls the behavior of the elevation prompt for administrators. The options are:- Elevate without prompting: Allows privileged accounts to perform an operation that requires elevation without requiring consent or credentials. Note: Use this option only in the most constrained environments.- Prompt for credentials on the secure desktop: When an operation requires elevation of privilege, the user is prompted on the secure desktop to enter a privileged user name and password. If the user enters valid credentials, the operation continues with the user's highest available privilege.- Prompt for consent on the secure desktop: When an operation requires elevation of privilege, the user is prompted on the secure desktop to select either Permit or Deny. If the user selects Permit, the operation continues with the user's highest available privilege.- Prompt for credentials: When an operation requires elevation of privilege, the user is prompted to enter an administrative user name and password. If the user enters valid credentials, the operation continues with the applicable privilege.- Prompt for consent: When an operation requires elevation of privilege, the user is prompted to select either Permit or Deny. If the user selects Permit, the operation continues with the user's highest available privilege.- Prompt for consent for non-Windows binaries: (Default) When an operation for a non-Microsoft application requires elevation of privilege, the user is prompted on the secure desktop to select either Permit or Deny. If the user selects Permit, the operation continues with the user's highest available privilege. The recommended state for this setting is: Prompt for consent on the secure desktop .

Rationale: One of the risks that the UAC feature introduced with Windows Vista is trying to mitigate is that of malicious software running under elevated credentials without the user or administrator being aware of its activity. This setting raises awareness to the administrator of elevated privilege operations and permits the administrator to prevent a malicious program from elevating its privilege when the program attempts to do so.

CCE Reference Number: CCE-37029-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.17.3

Compliance: Ensure 'User Account Control: Behavior of the elevation prompt for administrators in Admin Approval Mode' is set to 'Prompt for consent on the secure desktop'

Trivial

Vulnerability Details

This policy setting controls the behavior of the elevation prompt for administrators. The recommended state for this setting is: Prompt for consent on the secure desktop.

Rationale: One of the risks that the UAC feature introduced with Windows Vista is trying to mitigate is that of malicious software running under elevated credentials without the user or administrator being aware of its activity. This setting raises awareness to the administrator of elevated privilege operations and permits the administrator to prevent a malicious program from elevating its privilege when the program attempts to do so.

CCE Reference Number: CCE-37029-6
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.17.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to Prompt for consent on the secure desktop:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\User Account Control: Behavior of the elevation prompt for administrators in Admin Approval Mode>

Impact: When an operation (including execution of a Windows binary) requires elevation of privilege, the user is prompted on the secure desktop to select either Permit or Deny. If the user selects Permit, the operation continues with the user's highest available privilege.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'User Account Control: Behavior of the elevation prompt for standard users' is set to 'Automatically deny elevation requests'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Automatically deny elevation requests: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\User Account Control: Behavior of the elevation prompt for standard users Impact: Users will need to provide administrative passwords to be able to run programs with elevated privileges. This could cause an increased load on IT staff while the programs that are impacted are identified and standard operating procedures are modified to support least privilege operations.

Vulnerability Details

This policy setting controls the behavior of the elevation prompt for standard users. The options are: Prompt for credentials: When an operation requires elevation of privilege, the user is prompted to enter an administrative user name and password. If the user enters valid credentials, the operation continues with the applicable privilege. Automatically deny elevation requests: When an operation requires elevation of privilege, a configurable access denied error message is displayed. An enterprise that is running desktops as standard user may choose this setting to reduce help desk calls. Prompt for credentials on the secure desktop: (Default) When an operation requires elevation of privilege, the user is prompted on the secure desktop to enter a different user name and password. If the user enters valid credentials, the operation continues with the applicable privilege. Note that this option was introduced in Windows 7 and it is not applicable to computers running Windows Vista or Windows Server 2008. The recommended state for this setting is: Automatically deny elevation requests.

Rationale: One of the risks that the User Account Control feature introduced with Windows Vista is trying to mitigate is that of malicious programs running under elevated credentials without the user or administrator being aware of their activity. This setting raises awareness to the user that a program requires the use of elevated privilege operations and requires that the user be able to supply administrative credentials in order for the program to run.

CCE Reference Number: CCE-36864-7

Compliance: Ensure 'User Account Control: Behavior of the elevation prompt for standard users' is set to 'Automatically deny elevation requests'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Automatically deny elevation requests:

<Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\User Account Control: Behavior of the elevation prompt for standard users>

Impact: When an operation requires elevation of privilege, a configurable access denied error message is displayed. An enterprise that is running desktops as standard user may choose this setting to reduce help desk calls.

Note: With this setting configured as recommended, the default error message displayed when a user attempts to perform an operation or run a program requiring privilege elevation (without Administrator rights) is "This program will not run. This program is blocked by group policy. For more information, contact your system administrator." Some users who are not used to seeing this message may believe that the operation or program they attempted is specifically blocked by group policy, as that is what the message seems to imply. This message may therefore result in user questions as to why that specific operation/program is blocked, when in fact, the problem is that they need to perform the operation or run the program with an Administrative account (or "Run as Administrator" if it is already an Administrator account), and they are not doing that.

Vulnerability Details

This policy setting controls the behavior of the elevation prompt for standard users. The recommended state for this setting is: Automatically deny elevation requests.

Rationale: One of the risks that the User Account Control feature introduced with Windows Vista is trying to mitigate is that of malicious programs running under elevated credentials without the user or administrator being aware of their activity. This setting raises awareness to the user that a program requires the use of elevated privilege operations and requires that the user be able to supply administrative credentials in order for the program to run.

Compliance: Ensure 'User Account Control: Detect application installations and prompt for elevation' is set to 'Enabled'

Trivial

Vulnerability Details

This policy setting controls the behavior of application installation detection for the computer. The options are:- Enabled: (Default for home) When an application installation package is detected that requires elevation of privilege, the user is prompted to enter an administrative user name and password. If the user enters valid credentials, the operation continues with the applicable privilege.- Disabled: (Default for enterprise) Application installation packages are not detected and prompted for elevation. Enterprises that are running standard user desktops and use delegated installation technologies such as Group Policy Software Installation or Systems Management Server (SMS) should disable this policy setting. In this case, installer detection is unnecessary. The recommended state for this setting is: Enabled.

Rationale: Some malicious software will attempt to install itself after being given permission to run. For example, malicious software with a trusted application shell. The user may have given permission for the program to run because the program is trusted, but if they are then prompted for installation of an unknown component this provides another way of trapping the software before it can do damage

CCE Reference Number: CCE-36533-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.17.5

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\User Account Control: Detect application installations and prompt for elevation Impact: Users will need to provide administrative passwords to be able to install programs.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'User Account Control: Only elevate UIAccess applications that are installed in secure locations' is set to 'Enabled'

Trivial

Vulnerability Details

This policy setting controls whether applications that request to run with a User Interface Accessibility (UIAccess) integrity level must reside in a secure location in the file system. Secure locations are limited to the following:- #x2026;\Program Files\, including subfolders- #x2026;\Windows\system32\- #x2026;\Program Files (x86)\, including subfolders for 64-bit versions of Windows Note: Windows enforces a public key infrastructure (PKI) signature check on any interactive application that requests to run with a UIAccess integrity level regardless of the state of this security setting. The options are:- Enabled: (Default) If an application resides in a secure location in the file system, it runs only with

UIAccess integrity.- Disabled: An application runs with UIAccess integrity even if it does not reside in a secure location in the file system. The recommended state for this setting is: Enabled.

Rationale: UIAccess Integrity allows an application to bypass User Interface Privilege Isolation (UIPI) restrictions when an application is elevated in privilege from a standard user to an administrator. This is required to support accessibility features such as screen readers that are transmitting user interfaces to alternative forms. A process that is started with UIAccess rights has the following abilities:- To set the foreground window.- To drive any application window using SendInput function.- To use read input for all integrity levels using low-level hooks, raw input, GetKeyState, GetAsyncKeyState, and GetKeyboardInput.- To set journal hooks.- To uses AttachThreadInput to attach a thread to a higher integrity input queue.

CCE Reference Number: CCE-37057-7
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 2.3.17.6

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\User Account Control: Only elevate UIAccess applications that are installed in secure locations Impact: If the application that requests UIAccess meets the UI Access setting requirements, Windows Vista starts the application with the ability to bypass most of the UIPI restrictions. If the application does not meet the security restrictions, the application will be started without UIAccess rights and can interact only with applications at the same or lower privilege level.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'User Account Control: Run all administrators in Admin Approval Mode' is set to 'Enabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled: Computer Configuration\Policies\Windows Settings\Security Settings\Local Policies\Security Options\User Account Control: Run all administrators in Admin Approval Mode Impact: Users and administrators will need to learn to work with UAC prompts and adjust their work habits to use least privilege operations.

Vulnerability Details

This policy setting controls the behavior of all User Account Control (UAC) policy settings for the computer. If you change this policy setting, you must restart your computer. The options are:- Enabled: (Default) Admin Approval Mode is enabled. This policy must be enabled and related UAC policy settings must also be set appropriately to allow the built-in Administrator account and all other users who are members of the Administrators group to run in Admin Approval Mode.- Disabled: Admin Approval Mode and all related UAC policy settings are disabled.

Note: If this policy setting is disabled, the Security Center notifies you that the overall security of the operating system has been reduced. The recommended state for this setting is: Enabled.

Rationale: This is the setting that turns on or off UAC. If this setting is disabled, UAC will not be used and any security benefits and risk mitigations that are dependent on UAC will not be present on the system.

CCE Reference Number: CCE-36869-6

There are no references for this vulnerability.	

Compliance: Ensure 'User Account Control: Switch to the secure desktop when prompting for elevation' is set to 'Enabled'	Trivial

Vulnerability Details

This policy setting controls whether the elevation request prompt is displayed on the interactive user's desktop or the secure desktop. The recommended state for this setting is: Enabled.

Rationale: Standard elevation prompt dialog boxes can be spoofed, which may cause users to disclose their passwords to malicious software. The secure desktop presents a very distinct appearance when prompting for elevation, where the user desktop dims, and the elevation prompt UI is more prominent. This increases the likelihood that users who become accustomed to the secure desktop will recognize a spoofed elevation prompt dialog box and not fall for the trick.

CCE Reference Number: CCE-36866-2
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 2.3.17.8

Solution Details

To establish the recommended configuration via GP, set the following UI path to Enabled:

Compliance: Ensure 'WDigest Authentication' is set to 'Disabled' — Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Disabled: Computer Configuration\Policies\Administrative Templates\SCM: Pass the Hash Mitigations\WDigest Authentication (disabling may require KB2871997)

Note: This Group Policy path does not exist by default. An additional Group Policy template (PtH.admx/adml) is required - it is included with Microsoft Security Compliance Manager (SCM).
Impact: None - this is the default behavior for Windows 8.1 and Server 2012 R2.

Vulnerability Details

When WDigest authentication is enabled, Lsass.exe retains a copy of the user's plaintext password in memory, where it can be at risk of theft. If this setting is not configured, WDigest authentication is disabled in Windows 8.1 and in Windows Server 2012 R2; it is enabled by default in earlier versions of Windows and Windows Server. For more information about local accounts and credential theft, review the "Mitigating Pass-the-Hash (PtH) Attacks and Other Credential Theft Techniques" documents. For more information about UseLogonCredential, see Microsoft Knowledge Base article 2871997: Microsoft Security Advisory Update to improve credentials protection and management May 13, 2014. The recommended state for this setting is: Disabled.

Rationale: Preventing the plaintext storage of credentials in memory may reduce opportunity for credential theft.

CCE Reference Number: CCE-38444-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 18.6.2

Compliance: Ensure 'Windows Firewall: Domain: Inbound connections' is set to 'Block (default)'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Block (default):

<Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Domain Profile\Inbound connections>

Impact: None - this is the default configuration.

Vulnerability Details

This setting determines the behavior for inbound connections that do not match an inbound firewall rule. The recommended state for this setting is: Block (default).

Rationale: If the firewall allows all traffic to access the system then an attacker may be more easily able to remotely exploit a weakness in a network service.

CCE Reference Number: CCE-38117-8
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 9.1.2

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Windows Firewall: Domain: Logging: Log dropped packets' is set to 'Yes'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Yes: Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Domain Profile\Logging Customize\Log dropped packets Impact: Information about dropped packets will be recorded in the firewall log file.

Vulnerability Details

Use this option to log when Windows Firewall with Advanced Security discards an inbound packet for any reason. The log records why and when the packet was dropped. Look for entries with the word DROP in the action column of the log. The recommended state for this setting is: Yes.

Rationale: If events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users.

CCE Reference Number: CCE-37523-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.1.9

False Positive Notes

Compliance: Ensure 'Windows Firewall: Domain: Outbound connections' is set to 'Allow (default)'	Trivial

Vulnerability Details

This setting determines the behavior for outbound connections that do not match an outbound firewall rule. In Windows Vista / Server 2008 and above, the default behavior is to allow connections unless there are firewall rules that block the connection. The recommended state for this setting is: Allow (default).

Rationale: Some people believe that it is prudent to block all outbound connections except those specifically approved by the user or administrator. Microsoft disagrees with this opinion, blocking outbound connections by default will force users to deal with a large number of dialog boxes prompting them to authorize or block applications such as their web browser or instant messaging software. Additionally, blocking outbound traffic has little value because if an attacker has compromised the system they can reconfigure the firewall anyway.

CCE Reference Number: CCE-36146-9
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.1.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to Allow (default): Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Domain Profile\Outbound connections Impact: None, this is the default configuration.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Compliance: Ensure 'Windows Firewall: Domain: Settings: Apply local connection security rules' is set to 'Yes (default)' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Yes (default): Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Domain Profile\Settings Customize\Apply local connection security rules Impact: If you configure this setting to No, administrators can still create firewall rules, but the rules will not be applied. This setting is available only when configuring the policy through Group Policy.

Vulnerability Details

This setting controls whether local administrators are allowed to create connection security rules that apply together with connection security rules configured by Group Policy. The recommended state for this setting is: Yes (default).

Rationale: Users with administrative privileges might create firewall rules that expose the system to remote attack.

CCE Reference Number: CCE-38040-2
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.1.6

Compliance: Ensure 'Windows Firewall: Domain: Settings: Display a notification' is set to 'No'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to No: Computer

Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Domain Profile\Settings Customize\Display a notification Impact: If you configure this policy setting to No, Windows Firewall will not display these notifications.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

Select this option to have Windows Firewall with Advanced Security display notifications to the user when a program is blocked from receiving inbound connections.

Note: When the Apply local firewall rules setting is configured to No, it's recommended to also configure the Display a notification setting to No. Otherwise, users will continue to receive messages that ask if they want to unblock a restricted inbound connection, but the user's response will be ignored. The recommended state for this setting is: No.

Rationale: Firewall notifications can be complex and may confuse the end users, who would not be able to address the alert.

CCE Reference Number: CCE-38041-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.1.4

Compliance: Ensure 'Windows Firewall: Private: Logging: Name' is set to '%SYSTEMROOT%System32logfilesfirewallprivatefw.log' Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to %SYSTEMROOT%\System32\logfiles\firewall\privatefw.log: Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Private Profile\Logging Customize\Name Impact: The log file will be stored in the specified file.

Vulnerability Details

Use this option to specify the path and name of the file in which Windows Firewall will write its log information. The recommended state for this setting is:
%SYSTEMROOT%\System32\logfiles\firewall\privatefw.log.

Rationale: If events are not recorded it may be difficult or impossible to determine the root cause of system problems or the unauthorized activities of malicious users.

CCE Reference Number: CCE-37569-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.2.7

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Windows Firewall: Private: Outbound connections' is set to 'Allow (default)' — Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This setting determines the behavior for outbound connections that do not match an outbound firewall rule. The default behavior is to allow connections unless there are firewall rules that block the connection. Important: If you set Outbound connections to Block and then deploy the firewall policy by using a GPO, computers that receive the GPO settings cannot receive subsequent Group Policy updates unless you create and deploy an outbound rule that enables Group Policy to work. Predefined rules for Core Networking include outbound rules that enable Group Policy to work. Ensure that these outbound rules are active, and thoroughly test firewall profiles before deploying. The recommended state for this setting is: Allow (default).

Rationale: Some people believe that it is prudent to block all outbound connections except those specifically approved by the user or administrator. Microsoft disagrees with this opinion, blocking outbound connections by default will force users to deal with a large number of dialog boxes prompting them to authorize or block applications such as their web browser or instant messaging software. Additionally, blocking outbound traffic has little value because if an attacker has compromised the system they can reconfigure the firewall anyway.

CCE Reference Number: CCE-38332-3
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.2.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to Allow (default): Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Private Profile\Outbound connections Impact: None, this is the default configuration.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Compliance: Ensure 'Windows Firewall: Private: Outbound connections' is set to 'Allow (default)'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Allow (default):

<Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Private Profile\Outbound connections>

Impact: None - this is the default configuration.

Vulnerability Details

This setting determines the behavior for outbound connections that do not match an outbound firewall rule. The recommended state for this setting is: Allow (default).

Note: If you set Outbound connections to Block and then deploy the firewall policy by using a GPO, computers that receive the GPO settings cannot receive subsequent Group Policy updates unless you create and deploy an outbound rule that enables Group Policy to work. Predefined rules for Core Networking include outbound rules that enable Group Policy to work. Ensure that these outbound rules are active, and thoroughly test firewall profiles before deploying.

Rationale: Some people believe that it is prudent to block all outbound connections except those specifically approved by the user or administrator. Microsoft disagrees with this opinion, blocking outbound connections by default will force users to deal with a large number of dialog boxes prompting them to authorize or block applications such as their web browser or instant messaging software. Compliance: Ensure 'Windows Firewall: Private: Settings: Apply local connection security rules' is set to 'Yes (default)'	Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to Yes (default): Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Private Profile\Settings Customize\Apply local connection security rules Impact: If you configure this setting to No, administrators can still create firewall rules, but the rules will not be applied. This setting is available only when configuring the policy through Group Policy.

Vulnerability Details

This setting controls whether local administrators are allowed to create connection security rules that apply together with connection security rules configured by Group Policy. The recommended state for this setting is: Yes (default).

Rationale: Users with administrative privileges might create firewall rules that expose the system to remote attack.

CCE Reference Number: CCE-36063-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.2.6

False Positive Notes

Compliance: Ensure 'Windows Firewall: Private: Settings: Display a notification' is set to 'No'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to No: Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Private

Profile\Settings Customize\Display a notification Impact: If you configure this policy setting to No, Windows Firewall will not display these notifications.

Vulnerability Details

Select this option to have Windows Firewall with Advanced Security display notifications to the user when a program is blocked from receiving inbound connections.

Note: When the Apply local firewall rules setting is configured to No, it's recommended to also configure the Display a notification setting to No. Otherwise, users will continue to receive messages that ask if they want to unblock a restricted inbound connection, but the user's response will be ignored. The recommended state for this setting is: No.

Rationale: Firewall notifications can be complex and may confuse the end users, who would not be able to address the alert.

CCE Reference Number: CCE-37621-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.2.4

False Positive Notes

Compliance: Ensure 'Windows Firewall: Public: Firewall state' is set to 'On (recommended)' | Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to On (recommended): Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Public Profile\Firewall state Impact: None, this is the default configuration.

Vulnerability Details

Select On (recommended) to have Windows Firewall with Advanced Security use the settings for this profile to filter network traffic. If you select Off, Windows Firewall with Advanced Security will not use any of the firewall rules or connection security rules for this profile. The recommended state for this setting is: On (recommended).

Rationale: If the firewall is turned off all traffic will be able to access the system and an attacker may be more easily able to remotely exploit a weakness in a network service.

CCE Reference Number: CCE-37862-0
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.3.1

False Positive Notes

Solution Details

To establish the recommended configuration via GP, set the following UI path to 16,384 KB or greater:

<Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Public Profile\Logging Customize\Size limit (KB)>

Impact: The log file size will be limited to the specified size, old events will be overwritten by newer ones when the limit is reached.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Windows Firewall: Public: Outbound connections' is set to 'Allow (default)'	Trivial

Vulnerability Details

This setting determines the behavior for outbound connections that do not match an outbound firewall rule. The default behavior is to allow connections unless there are firewall rules that block the connection. Important: If you set Outbound connections to Block and then deploy the firewall policy by using a GPO, computers that receive the GPO settings cannot receive subsequent Group Policy updates unless you create and deploy an outbound rule that enables Group Policy to work. Predefined rules for Core Networking include outbound rules that enable Group Policy to work. Ensure that these outbound rules are active, and thoroughly test firewall profiles before deploying. The recommended state for this setting is: Allow (default).

Rationale: Some people believe that it is prudent to block all outbound connections except those specifically approved by the user or administrator. Microsoft disagrees with this opinion, blocking outbound connections by default will force users to deal with a large number of dialog boxes prompting them to authorize or block applications such as their web browser or instant messaging software. Additionally, blocking outbound traffic has little value because if an attacker has compromised the system they can reconfigure the firewall anyway.

CCE Reference Number: CCE-37434-8
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.3.3

Solution Details

To establish the recommended configuration via GP, set the following UI path to Allow (default): Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Public Profile\Outbound connections Impact: None, this is the default configuration.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Compliance: Ensure 'Windows Firewall: Public: Settings: Apply local connection security rules' is set to 'No'

Trivial

Solution Details

To establish the recommended configuration via GP, set the following UI path to No: Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Public Profile\Settings Customize\Apply local connection security rules Impact: If you configure this setting to No, administrators can still create firewall rules, but the rules will not be applied. This setting is available only when configuring the policy through Group Policy.

Vulnerability Details

This setting controls whether local administrators are allowed to create connection security rules that apply together with connection security rules configured by Group Policy. The recommended state for this setting is: No.

Rationale: Users with administrative privileges might create firewall rules that expose the system to remote attack.

CCE Reference Number: CCE-36268-1
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.3.6

Compliance: Ensure 'Windows Firewall: Public: Settings: Display a notification' is set to 'Yes'	Trivial

Vulnerability Details

Select this option to have Windows Firewall with Advanced Security display notifications to the user when a program is blocked from receiving inbound connections.

Note: When the Apply local firewall rules setting is configured to Yes, it is also recommended to also configure the Display a notification setting to Yes. Otherwise, users will not receive messages that ask if they want to unblock a restricted inbound connection. The recommended state for this setting is: Yes.

Rationale: Some organizations may prefer to avoid alarming users when firewall rules block certain types of network activity. However, notifications can be helpful when troubleshooting network issues involving the firewall.

CCE Reference Number: CCE-38043-6
CIS_Microsoft_Windows_Server_2012_R2_Benchmark_v2.2.0: 9.3.4

Solution Details

To establish the recommended configuration via GP, set the following UI path to Yes: Computer Configuration\Policies\Windows Settings\Security Settings\Windows Firewall with Advanced Security\Windows Firewall with Advanced Security\Windows Firewall Properties\Public Profile\Settings Customize\Display a notification Impact: If you configure this policy setting to No, Windows Firewall will not display these notifications.

False Positive Notes

Compliance: Set 'NetBIOS node type' to 'P-node' (Ensure NetBT Parameter 'NodeType' is set to '0x2 (2)') (MS Only)

Trivial

Solution Details

To establish the recommended configuration, set the following Registry value to 0x2 (2) (DWORD):
HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\NetBT\Parameters:NodeType

Note: This change does not take effect until the computer has been restarted. Note #2: Although Microsoft does not provide an ADMX template to configure this registry value, a custom .ADM template (Set-NetBIOS-node-type-KB160177.adm) is provided in the CIS Benchmark Remediation Kit to facilitate its configuration. Be aware though that simply turning off the group policy setting in the .ADM template will not "undo" the change once applied. Instead, the opposite setting must be applied to change the registry value to the opposite state.

Impact: NetBIOS name resolution queries will require a defined and available WINS server for external NetBIOS name resolution. If a WINS server is not defined or not reachable, and the desired hostname is not defined in the local cache, local LMHOSTS or HOSTS files, NetBIOS name resolution will fail.

Vulnerability Details

This parameter determines which method NetBIOS over TCP/IP (NetBT) will use to register and resolve names. A B-node (broadcast) system only uses broadcasts. A P-node (point-to-point) system uses only name queries to a name server (WINS). An M-node (mixed) system broadcasts first, then queries the name server (WINS). An H-node (hybrid) system queries the name server (WINS) first, then broadcasts. The recommended state for this setting is: NodeType - 0x2 (2).

Rationale: In order to help mitigate the risk of NetBIOS Name Service (NBT-NS) poisoning attacks, setting the node type to P-node will prevent the system from sending out NetBIOS broadcasts.
CIS_Microsoft_Windows_Server_2016_Benchmark_v1.0.0: 18.4.4.1

Content Security Policy Missing — Trivial

Solution Details

Add a Content Security Policy (CSP) based upon your specific needs. Please refer to the documentation on CSPs to configure the right policy.
Caveats:
Please note the inclusion of a Content Security Policy (CSP) does not replace good security hygiene. Using a CSP to block known Cross-site Scripting (XSS) vulnerabilities (for example) is not recommended.

Vulnerability Details

Not having a Content-Security-Policy (CSP) potentially opens a website to vulnerabilities such as, but not limited to: cross-site scripting (XSS), clickjacking and other code injection attacks resulting from the execution of malicious content in the trusted web page context.

False Positive Notes

We are checking to see if either an html meta tag or "Content-Security-Policy" header is missing from an audited web-page. If the tag format or header name changes in the future. This could lead to a false positive.

CVSS Base Score: 2.6

Daytime Service Detected — Trivial

Solution Details

The daytime service is an inessential service which can safely be disabled without experiencing adverse consequences in other network or program functionality. The following are instructions for disabling the daytime service on a system:

Unix/Linux with inetd: Comment out 'daytime' in the /etc/inetd.conf file and restart inetd.

Unix with xinetd: Change directory to the xinetd daemon directory (typically /etc/xinetd.d, as defined in the xinetd.conf file), and edit the daytime and daytime-udp files (if they exist) and either change the existing line 'disable' to 'disable = yes' or add the line between the curly braces if it does not exist. If individual configuration files are not used for each service, edit the xinetd.conf file and follow the same instructions for each instance of the 'daytime' service. Restart the xinetd service after all changes have been saved.

Windows: Remove the Simple TCP/IP Services from the network configuration.

Cisco: At the enable console, in configuration mode, enter 'no service tcp-small-servers' and 'no service udp-small-servers'.

Others: Consult the system documentation.
Caveats:
Disabling the Simple TCP/IP Services on Windows will also disable Character Generator, Discard, Echo, and Quote of the Day.
Workarounds:
Restrict access to TCP/UDP port 13 via host or network based firewall rules to authorized hosts only.

False Positive Notes

This item is not a false positive. Appropriate remediation is required.

Vulnerability Details

The host is running the daytime service. The daytime service is a debugging tool which listens on a port for incoming packets and responds with a packet containing a date and time.
Impact:
The format of the date that is issued by the daytime service may help an attacker guess the operating system type of the system which is running the service. Additionally, the UDP version of daytime service can be leveraged by an attacker to flood the server via a "UDP bomb" or "packet storm", resulting in a denial-of-service condition on the vulnerable host.

Default IIS Webpage Detected | Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This host is running Microsoft's IIS webserver. The default webpage that has been detected on this host implies this host may not be configured for optimal security. An attacker can leverage this to gain access to or information about this host.

Solution Details

Please ensure this host is configured to appropriately restrict access

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference
There are no references for this vulnerability.	

Discard Service Detected | Trivial

Solution Details

The discard service is an inessential service which can safely be disabled without experiencing adverse consequences in other network or program functionality. The following are instructions for disabling the discard service on a system:

Unix/Linux with inetd: Comment out 'discard' in the /etc/inetd.conf file and restart inetd.

Unix with xinetd: Change directory to the xinetd daemon directory (typically /etc/xinetd.d, as defined in the xinetd.conf file), and edit the discard and discard-udp files (if they exist) and either change the existing line 'disable' to 'disable = yes' or add the line between the curly braces if it does not exist. If individual configuration files are not used for each service, edit the xinetd.conf file and follow the same instructions for each instance of the 'discard' service. Restart the xinetd service after all changes have been saved.

Windows: Remove the Simple TCP/IP Services from the network configuration.

Cisco: At the enable console, in configuration mode, enter 'no service tcp-small-servers' and 'no service udp-small-servers'.

Others: Consult the system documentation.
Caveats:
Disabling the Simple TCP/IP Services on Windows will also disable Character Generator, Daytime, Echo, and Quote of the Day.
Workarounds:
Restrict access to TCP/UDP port 9 via host or network based firewall rules to authorized hosts only.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

The host is running the discard service. The discard service is a network debugging tool used for testing and measurement as defined by RFC 863. When the discard service receives a packet, it immediately throws the packet away without sending a response to the client.
Impact:
The presence of the discard service has little to no impact to the security of this host. However, exposing any service which is not specifically used for business purposes needlessly increases the attack surface (aka the potential for attack) for a given host.
Caveats:
The discard service is similar to /dev/null on a Unix/Linux host and will immediately and silently throw away all data that it receives. Because the service throws away data without sending a response, the vulnerability check identifies the discard service only based on the presence of TCP or UDP port 9.

Echo Service | Trivial

Vulnerability Details

The echo service is a simple network service which responds to incoming packets with an exact duplicate, or echo, of the packet. It is possible for an attacker to leverage the echo service in order to cause a denial-of-service condition.
Impact:
An attacker can utilize all of a system's resources by continually requesting responses from the echo service. The impact of this attack will vary depending on the purpose of the victim machine. Client-facing, internet-accessible systems have a higher liability than user workstations.

Solution Details

The echo service is intended for testing purposes only and can safely be disabled without experiencing adverse behavior on the network.

Disable the echo service on the vulnerable host by following the appropriate instructions for the affected system.

Unix: Comment out 'echo' in the /etc/inetd.conf file and restart inetd.
Windows: Remove the Simple TCP/IP Services from the network configuration.
Cisco: At the enable console, in configuration mode, enter 'no service tcp-small-servers' and 'no service udp-small-servers'.
Others: Consult the system documentation.

False Positive Notes

This item is not a false positive. Appropriate remediation is required.

URL	http://www.cert.org/advisories/CA-1996-01.html

HTTP TRACE/TRACK Method Enabled | Trivial

Solution Details

The HTTP TRACE/TRACK method was designed for debugging and diagnostic purposes. Consider disabling HTTP TRACE/TRACK support in the web server if it is unnecessary.

Apache web servers:
Use the Apache mod_rewrite module to deny HTTP TRACE/TRACK requests or to permit only the methods needed to meet site requirements and policy. A basic example of this is to use the following in the httpd configuration file. This must be defined in each virtual host if virtual hosting is used:

```
RewriteEngine On
RewriteCond % ^TRACE
RewriteRul: .* - [F]
```

Windows 2003 Server users:
Download the WinHttpTraceCfg.exe from http://msdn.microsoft.com/en-us/library/aa384119%28VS.85%29.aspx.

Windows IIS web server users:
Install URLScan tool from http://technet.microsoft.com/en-us/security/cc242650.aspx.

Default Configuration of URL Scan will only allow GET, HEAD, and POST
Advanced Configuration of URLScan is available at the Microsoft library article cc242650 linked above.

1. Navigate to %windir%\system32\inetsrv\urlscan
2. Edit urlscan.ini
3. Configure as desired

Restart IIS
1. Navigate to Administrative Tools
2. Open Internet Information Services
3. Right Click on desired web server
4. Select All Tasks -> Restart IIS

Windows IIS with Citrix NFuse:
This solution from Microsoft will not work on hosts running Citrix NFuse, and will force a complete system reload if applied to systems running Citrix NFuse.

For other types of web servers, please contact the vendor or consult the host documentation for further information.

Vulnerability Details

The TRACE/TRACK method of the Hypertext Transfer Protocol (HTTP) is defined to return the contents of client HTTP requests in the entity-body of the TRACE/TRACK response. The TRACK method is an alias of the TRACE method on certain servers. These methods are generally enabled for debugging purposes, and when enabled, can be leveraged by attackers to access sensitive information, such as cookies or authentication data, which is contained in the HTTP headers of the request and that are not otherwise available via the DOM interface. In the presence of other cross-site domain vulnerabilities in web browsers, sensitive header information can be read from domains other than the target of the HTTP TRACE/TRACK request.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

ICMP Timestamp Request — Trivial

Solution Details

Use access control to block incoming ICMP timestamp requests (ICMP 13), and outgoing ICMP timestamp replies (ICMP 14).

Vulnerability Details

Internet Control Message Protocol (ICMP) is an integral component of Internet Protocol (IP) implementations and is defined in IETF RFC 792. ICMP messages are used to support diagnostic and error reporting when problems are encountered by IP datagrams.

The ICMP RFC specifies a timestamp request and response which divulges the current date and time that is being used by the target host. Unfortunately, some programs and operating systems use the current time to generate pseudo random numbers that are used for encryption, session state, or other purposes. An attacker can use the response to an ICMP timestamp request to aid in defeating weak authentication systems that rely on this information.

Impact:
An attacker that is able to use the ICMP timestamp information from a vulnerable system to compromise a cryptographic system or authentication scheme will be able to gain access to the vulnerable system. This level of access differs greatly on a case by case basis.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

IPv6 Enabled — Trivial

Vulnerability Details

This asset has IPv6 enabled. If IPv6 is not being used by the asset, it should be disabled.
Impact:
An attacker can exploit IPv6 in Windows networks to spoof DNS replies by acting as a malicious DNS server and redirect traffic to an attacker specified endpoint. The attacker could then relay credentials and authenticate to other services within the network.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

IPv6 can be disabled on specific network interfaces via the following steps.

1. Open Network and Sharing Center via the Control Panel.
2. Choose "Change adapter settings"
3. Right-click and choose "Properties" for the desired network adapter.
4. Scroll down and uncheck the box for "Internet Protocol Version 6 (TCP/IPv6)".
5. Click 'OK'. No restart is required.

IPv6 can also be disabled on all interfaces by creating and setting a registry key.

Key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip6\Parameters
Value: DisabledComponents = ff
Value Type: DWORD (Hexadecimal value)

This method does require a system restart. For reference, the checkboxes mentioned above will remain checked even if the registry key option is implemented.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

Kerberos User Enumeration Detected | Trivial

Solution Details

This is a feature of the Kerberos protocol, therefore the only way to prevent it from being used for user enumeration is to restrict access to the Kerberos port on this host. However, this would also prevent legitimate use of the service.

Vulnerability Details

The Kerberos service can be used to determine if a user is enabled, disabled, or does not exist based on responses to AS-REQ Kerberos packets.
Impact:
If the domain of a Kerberos service is known, an unauthenticated remote attacker can enumerate the users of that domain to help with further attacks.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Link Local Multicast Name Resolution (LLMNR) Enabled | Trivial

Vulnerability Details

The Link Local Multicast Name Resolution (LLMNR) protocol is enabled on this asset. Thus, this asset will make LLMNR broadcasts to resolve hostnames on the local subnet.
Impact:
An attacker could potentially spoof LLMNR responses in order to obtain NTLMv2 credentials meant for a legitimate host.

Solution Details

The LLMNR protocol can be disabled by setting either of the following registry values to 0. If this value name does not exist, it can be created by adding a new DWORD value name and setting it to 0.
Note: If the key does not even exist, a new key may have to be added as well.

1.) Key/value
HKEY_LOCAL_MACHINE\Software\policies\Microsoft\Windows NT\DNSClient > EnableMulticast=0

2.) Key/value
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\services\Dnscache\Parameters > EnableMulticast=0

The default behavior is for LLMNR multicast to be enabled if nothing is modified.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

Microsoft RDP Network Level Authentication Disabled | Trivial

Solution Details

Consider enabling Network Level Authentication.

Vulnerability Details

This asset appears to be running a Microsoft RDP service without Network Level Authentication (NLA) enabled.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

CVSS Vector: AV:N/AC:L/Au:N/C:N/I:N/A:N

Type	Reference

NetBIOS Over TCP/IP Enabled — Trivial

Vulnerability Details

The NetBIOS service is enabled on this asset. This means that this asset will initiate NetBIOS broadcasts and queries. Additionally, this asset will respond to NetBIOS requests made by other assets on this network.
Impact:
It may be possible for an attacker to spoof other assets on the network by responding to the NetBIOS requests.

Solution Details

Disable NetBIOS over TCP/IP.

NetBIOS over TCP/IP can be disabled by setting the following registry key value to 2. If the key does not exist, by default NetBIOS over TCP/IP is enabled, it can be created:

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\services\NetBT\Parameters\Interfaces\<Interface GUID>\NetbiosOptions

This registry key value is of type DWORD.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

NTLM Authentication Host Information Disclosure

Trivial

Vulnerability Details

This service supports NTLM authentication. When sending a blank NTLM type 1 message, the server will respond with a NTLM type 2 message that contains the Active Directory domain, NetBIOS hostname, DNS hostname and DNS domain name for the host.
Impact:
Attackers can use this to discover the Active Directory domain and use it in further attacks against the network, such as brute forcing user logins for an Outlook Web Access server.

Solution Details

As the detection of the domain and host information is a feature of the NTLM authentication protocol, it is not a vulnerability. Therefore, no solution is required.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

Remote Desktop Protocol Allows Man in the Middle

Trivial

Vulnerability Details

This host is running Microsoft's Remote Desktop Protocol (RDP) server, formerly known as Microsoft's Terminal Services, for remote GUI administration of this host. The current configuration of this host's RDP server is vulnerable to a man-in-the-middle attack. The vulnerability arises due to the fact that the private key used to sign the RDP server's public key is hardcoded into mstlsapi.dll. This library is available publicly and can be used by an attacker to calculate the valid signature required to perform a man-in-the-middle attack. Note that this vulnerability exists even when native RDP encryption is being used between the RDP client and RDP server.
Impact:
An attacker that has successfully performed the man-in-the-middle attack could gain sensitive information including keystrokes sent from the RDP client to the RDP server. Tools such as Cain and Abel not only perform this attack but also attempt to automatically extract passwords typed in during RDP sessions.
Caveats:
An RDP server that allows Negotiate instead of requiring TLS/SSL may also be vulnerable because the attacker could force an RDP session to use RDP native encryption. This caveat is predicated on the RDP client's configuration also allowing native RDP encryption in place of requiring TLS/SSL.

Solution Details

Ensure that the RDP server is configured to require TLS/SSL encryption and authentication. For more information on configuring Microsoft's RDP server, please consult Microsoft's documentation for the specific version of the RDP server running on this host.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

RPC Portmap Service — Trivial

False Positive Notes

This item is not a false positive. Appropriate remediation is required.

Solution Details

Please disable this service if it is not in use. For Internet-facing systems, filter TCP and UDP port 111 inbound. Solaris systems should also filter TCP and UDP port 32771. If this service is required, please ensure the libc/glibc library has been patched against the XDR integer overflow vulnerabilities, and this host is running the latest version of RPC portmap linked in the References List of the vulnerability details section.

Vulnerability Details

This host is running the RPC 'portmap' service vulnerable to subversion. The portmapper acts as a directory service for locating RPC applications on this host, typically port 111. Attackers can leverage this service by sending UDP requests to rpcbind listening above port 32770 to determine if a vulnerable RPC application is running on this host.

CVSS Base Score: 7.5

SMB Domain SID Disclosure

Trivial

Vulnerability Details

This host divulges the Windows domain SID through a NULL session. An attacker could use this SID to enumerate domain users in conjunction with the LookupAccountSid or LookupAccountName functions.

Solution Details

Upgrade the Windows OS and disable anonymous access to this host. If the host does not need to participate on a Windows network (file/printer sharing, RPC, DCOM, Remote Registry access, etc.), the Server service can safely be disabled. For more information, see the Microsoft Knowledge Article linked in the References List of the vulnerability details. If this host is accessible externally, filtering access to TCP ports 135, 138, 139, and 445 as well as UDP ports 137, 138, and 139 is recommended.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

SMB Native LanMan Version

Trivial

Vulnerability Details

Lan Manager was originally developed in the 1980's as a network operating system by Microsoft in conjunction with other vendors such as IBM and 3COM. Since then, the Lan Manager has been evolved by Microsoft into the NT Lan Manager and is heavily used in Windows networking. This vulnerability check collects and displays information obtained from the Lan Manager including Lan Manager version, OS, and domain.
Impact:
Information provided by the Lan Manager can be used to fingerprint specific details about this host including its OS and domain. This information is not an information leak but rather specifically provided for Lan Manager functionality.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

No solution is required.

SMB Null Session Authentication — Trivial

Solution Details

Please note the below settings will NOT remediate the "SMB NULL Session" vulnerability; it will only prevent an attacker from obtaining sensitive information via the NULL session.

To configure local security policy settings, open the Local Security Policy editor within the Administrative Tools and select SecuritySettings\Local Policies\SecurityOptions. Several options exist which pertain to SMB NULL sessions:

1. Network access: Allow anonymous SID/Name translation
2. Network access: Do not allow anonymous enumeration of SAM accounts
3. Network access: Do not allow anonymous enumeration of SAM accounts and shares
4. Network access: Let Everyone permissions apply to anonymous users
5. Network access: Named Pipes that can be accessed anonymously
6. Network access: Shares that can be accessed anonymously

To fully lock down SMB NULL session access, disable items 1 and 4, enable items 2 and 3, and set items 5 and 6 to an empty list. For detailed option information and security implications concerning the options listed above, refer to Microsoft's Threats and Countermeasures Guide for Security Options located at the URL http://technet.microsoft.com/en-us/library/dd349805(v=ws.10).

Vulnerability Details

This host is participating in a Windows-based network and allows NULL SMB sessions to be established. A NULL SMB session is an anonymous connection from one computer to another (usually both Windows computers) using the Windows Server Message Block (SMB) protocol.

SMB, also known as CIFS, is typically used for sharing resources on a network including files and printers. SMB also provides a robust inter-process communication (IPC) layer to allow processes to authenticate and communicate with each other either locally or over the network.
Impact:
An intruder can attach to the IPC$ (interprocess communications) share and gain information about the host, such as usernames, running services, and available NetBIOS shares. The actual level of information exposed depends on the security settings of this host.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

SSL Certificate: Outdated Version — Trivial

Solution Details

Obtain a Version 3 SSL Certificate from a trusted Certificate Authority for this service.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

The SSL Certificate that is presented by this service uses an outdated certificate version. SSL Certificate versions prior to version 3 are not considered to be cryptographically strong and are no longer acceptable for public use.

Impact:
SSL Certificates represent a method for clients of a service to trust that the remote server or service is actually the party it claims to be. Using a deprecated version of SSL Certificate, can make it difficult for clients of the service to trust that communication is occurring with the intended recipient.

Trusting remote services can be especially important if the service which is being accessed is a login page, an advisory page, etc. Using a deprecated SSL Certificate version makes the service vulnerable to attack by other parties who can now masquerade as the legitimate service more easily. The impact of an attack on this type of vulnerability includes that false information can be propagated as legitimate, that credentials be given to an attacker, or that legitimate users can be susceptible to other, more creative attacks.

CVSS Base Score: 0

SSL Certificate: Weak Signature Algorithm SHA-1 — Trivial

Solution Details

Obtain a new SSL Certificate which is signed with a stronger hashing algorithm like SHA-2 from a trusted Certificate Authority. Cisco has released an update to address this issue which is available through the vendor link in the References List. Microsoft has also released an update to address this issue which is available through the vendor link in the References List.

Vulnerability Details

The SSL Certificate running on this service was signed with the SHA-1 hashing algorithm. For a stronger alternative to the SHA-1 hashing algorithm, utilize SHA-2 hashing algorithms (otherwise known as SHA-224, SHA-256, SHA-384 and SHA-512). NIST currently encourages all entities to move towards using SHA-2 family hashing algorithms over SHA-1. Additionally, standards such as PCI-DSS reference NIST as a guideline for preferring SHA-2 over SHA-1.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

SSL Connection: Anonymous (non-authenticated) Key-Agreement Protocols Permitted

Trivial

Solution Details

Disable anonymous key exchange protocols.

The following items can be added to the Apache site configuration for the SSLCipherSuite directive: "!ADH" and "!AECDH"

Vulnerability Details

Keys used during the exchange for Anonymous Diffie-Hellman and Anonymous Elliptic Curve Diffie-Hellman protocols do not provide authentication. As a result, these protocols are vulnerable to Man-in-The-Middle (MiTM) attacks.
Impact:
An attacker in position to perform a Man-in-The-Middle (MiTM) attack could intercept and eavesdrop or modify traffic between the client and server using this key exchange protocol.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 0

SSL Connection: SSL/TLS Supports RC4 Ciphers — Trivial

Solution Details

Disable support for the RC4 cipher suites in favor of TLS 1.2 AES-GCM cipher suites. Consult your specific vendor documentation for more information.

Vulnerability Details

RC4 is a fast stream cipher that has seen increased use as a means of mitigating the BEAST attack against CBC mode ciphers. However, RC4 suffers from several bytes biases in the keystream that could allow an attacker to extract pieces of plaintext from a TLS/SSL session that uses the RC4 cipher.
Impact:
A successful attack against a TLS/SSL session that uses the RC4 cipher could result in a leak of a limited amount of plaintext such as user credentials.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

CVSS Base Score: 4.3

SSL Connection: SSLv3/TLSv1 Supports CBC Mode Ciphers — Trivial

Vulnerability Details

The SSL/TLS endpoint supports encryption using block ciphers (such as AES and DES) that operate in Cipher-Block Chaining (CBC) mode.

SSL ciphers are cryptographic algorithms used for transmitting certificates, establishing session keys, performing authentication, etc. Ciphers that operate in CBC mode are cryptographically weaker than other non-CBC mode ciphers of similar bit strengths. Additionally, SSLv3.0 and TLSv1.0 use CBC mode in such a way that cause the entire encrypted session to share one CBC session which creates a particularly weak situation that is subject to eavesdropping attacks and plain text insertion attacks.

The "Vulnerability Data" section includes a line which states whether the "Browser Exploit Against SSL/TLS" (BEAST) has been mitigated. This is determined as follows:

1. BEAST not mitigated: all supported ciphers are CBC mode ciphers

The scanner was unable to connect to the remote server using a non-CBC mode cipher.

2. BEAST not mitigated: server ignores client order but prefers CBC mode
ciphers

The scanner provided the remote service with non-CBC and CBC mode ciphers with a preference for non-CBC mode ciphers, but the service still selected a CBC mode cipher.

3. BEAST not mitigated: server respects client cipher order

The scanner provided the remote service with CBC and non-CBC mode ciphers, with a preference for CBC mode ciphers, and the service selected a CBC mode cipher.

4. BEAST mitigated: server ignores client order and prefers non-CBC mode
ciphers

The scanner determined that the remote service attempts to mitigate BEAST by preferring non-CBC mode ciphers.
Impact:
The method for selecting the cipher which will be used during an SSL/TLS session is selected during initialization of the connection. Since the remote server supports ciphers that operate in CBC mode, a client is able to establish a connection using a cipher from this family. In this scenario, the communication stream is susceptible to cryptographic attacks.

Solution Details

Supporting ciphers which operate in cipher-block chaining (CBC) mode is not a vulnerability and does not necessarily require remediation.

The "Vulnerability Data" section includes a line which references the status of BEAST mitigation. BEAST stands for Browser Exploit Against SSL/TLS -- a client-side attack which exploits the weaknesses of ciphers that operate in CBC mode. The server can promote the security of clients by preferring ciphers which do not operate in CBC mode.

In order to mitigate the BEAST attack, the server should be configured to select any of the provided, and supported, non-CBC mode ciphers that the client offers during SSL/TLS negotiation, over the offered CBC mode ciphers. Implementing this behavior will allow continued operability of the server with many SSL/TLS clients, while providing a best effort towards mitigating attacks against CBC mode ciphers.

On Microsoft Windows based operating systems, SSL cipher list ordering may be changed through the group policy editor as follows:

1. Open a command prompt and type in gpedit.msc
2. Navigate to Computer Configuration -> Administrative Templates -> Network -> SSL Configuration Settings
3. Open the SSL Cipher Suite Order setting
4. Change the order of the ciphers and save

For Apache using mod_ssl, the SSLProxyCipherSuite directive may be used to change the cipher order. Apache can also use the SSLHonorCipherOrder and SSLCipherSuite directives to control cipher order as follows:

```
SSLHonorCipherOrder On
SSLCipherSuite RC4-SHA:HIGH:!ADH
```

In general, this configuration will be specific to the application using SSL. For specific SSL configuration instructions, consult the appropriate user manual for the application using SSL or contact the vendor

of the application for more information.
Caveats:
Some browser-side implementations of SSL v3.0 and TLS v1.0 block ciphers which operate in cipher-block chaining (CBC) mode are susceptible to a client-side attack through the browser. This attack is known as the Browser Exploit Against SSL/TLS (BEAST). Threat of attack through this vector can be lessened by preferring stream ciphers, such as RC4, over these CBC mode block ciphers.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

SSL Connection: Sweet32 Vulnerability — Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

SSL connections which support DES, Triple DES and Blowfish CBC mode cipher suites with block sizes of 64 bits are vulnerable to a Birthday Attack when an attacker is able to capture a long duration session. This is known as the "Sweet32" attack.

Impact:
An attacker who is able to capture an encrypted session which is using the vulnerable CBC mode cipher suites that runs long enough to generate more than 785 gigabytes of traffic, may be able to perform a block cipher collision and recover sensitive data such as session cookies or passwords, or other encrypted data. The difficulty and amount of captured data required to exploit this vulnerability is expected to decrease as attackers improve on the methods used in the proof of concept for this attack.

Solution Details

To mitigate this issue, ensure that all available cipher suites for a given service use at least 128-bit ciphers or disable DES, Triple DES and Blowfish CBC mode ciphers. If it is not feasible to disable these cipher suites, consider limiting HTTP/1.1 Keep-Alive, SPDY and HTTP/2 when 64-bit block ciphers are used in order to prevent a session from running long enough to be viable for a Sweet32 attack.

SSL Connection: TLS Compression Enabled

Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

The remote TLS endpoint supports compression. TLS compression has been demonstrated to leak information by not obfuscating the length of the underlying compressed and unencrypted data.

One attack that exploits this weakness is called "Compression Ratio Info-leak Made Easy" (CRIME). CRIME allows man-in-the-middle attackers to decrypt data by injecting guesses of the content of the plaintext into the encrypted traffic and then observing differences in the length of the resulting encrypted packets.
Impact:
An attacker who is able to achieve a man-in-the-middle position and carry out the CRIME attack will be able to read the content of encrypted traffic. This could potentially divulge sensitive cookies, or session IDs which could then be reused by the attacker to gain access to protected resources.

Solution Details

The attacks against TLS compression can be mitigated server-side by disabling this functionality on the affected server.

Apache versions 2.4.3 and 2.2.24 using mod_ssl support an option which allows the compression functionality to be disabled. This behavior can be achieved by specifying "SSLCompression off" in the httpd.conf file.

Apache using mod_gnutls supports toggling of TLS compression through the GnuTLSPriorities flag. TLS compression can be disabled by specifying "!COMP-DEFLATE".

SSL Connection: Weak Ciphers Enabled

Trivial

Solution Details

Configure the server to reject weak SSL ciphers. All supported SSL cipher suites should be at least 128 bit strength. If SSL was included as a bundled software package, please contact the vendor for remediation details.

Common web server implementations:
Apache v2 - Modify the SSLCipherSuite directive in the httpd.conf or ssl.conf file to not allow the use of weak ciphers and restart the Apache server. Note that this may prevent older web browsers from connecting to the website. For more information on specific SSLCipherSuite directives, please refer the Apache mod_ssl SSLCipherSuite online documentation at
http://httpd.apache.org/docs/2.0/mod/mod_ssl.html#sslciphersuite.

Microsoft IIS - Please see Microsoft's official enterprise support blog at
http://blogs.technet.com/b/askds/archive/2011/05/04/speaking-in-ciphers-and-other-enigmatic-tongues.aspx
Note that this may prevent older web browsers from connecting to the website.

For other web servers, please consult the vendor specific documentation for the server type.

Vulnerability Details

The SSL protocol supports a suite of ciphers, or cryptographic algorithms, for transmitting certificates, establishing session keys, performing authentication, etc. Some of these ciphers use keys that are very small and thus cryptographically weak. The full set of available ciphers is not equal to the certificate signature algorithm listed in the SSL certificate.

This host's SSL connection accepts one or more weak ciphers as an acceptable transport mechanism for data. A remote attacker with access to an upstream node can leverage this weakness to perform a

"Man in the Middle" attack against this SSL connection, resulting in loss of confidentiality of the transmitted data.

OpenSSL provides a list of SSL cipher suite names and their OpenSSL equivalents which is linked in the reference list of the vulnerability details.

False Positive Notes

This item is not a false positive. Appropriate remediation is required.

TDS SQL Database Service

Trivial

Vulnerability Details

This host is running a database service that uses the TDS network protocol. The TDS protocol, which stands for the Tabular Data Stream protocol, is used by the Sybase Adaptive Server Anywhere and Microsoft SQL Server database engines. It is a low level protocol that does not provide password or data encryption, and is vulnerable to standard passive network analysis attacks. An attacker who is able to view network traffic between the client and the server can leverage this to obtain database authentication credentials as well as capture the results of any database queries. Aside from the sensitive information leak, an attacker could parlay obtained authentication credentials to completely compromise this host. The TDS service should never be exposed to the Internet.

Solution Details

Please consider using ODBC or OLEDB as a means of remotely accessing this host's database server. If the TDS protocol is required for performance reasons or because other methods of database access are not feasible, please tunnel the database connections through an encrypted VPN or SSL connection.

In general, do not allow database services to be accessed directly from the Internet, especially via TDS.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

TLS Connection: TLS Version 1.0 Enabled

Trivial

Vulnerability Details

This host appears to support Transport Layer Security version 1.0 (TLSv1.0). The PCI Security Standards Council has declared that TLSv1.0 no longer meets minimum security standards. This is in large part due to vulnerabilities within the TLSv1.0 protocol that cannot be fixed.

Solution Details

Due to its inherent weaknesses, please consider disabling support for TLSv1.0 and only supporting newer protocols such as TLSv1.1 and TLSv1.2. Consult your specific vendor documentation for more information.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

URL	https://en.wikipedia.org/wiki/Transport_Layer_Security

TLS Connection: TLS Version 1.1 Enabled

Trivial

Solution Details

Due to its inherent weaknesses, please consider disabling support for TLSv1.1 and only supporting newer protocols such as TLSv1.2 and TLSv1.3. Consult your specific vendor documentation for more information.

Vulnerability Details

This host appears to support Transport Layer Security version 1.1 (TLSv1.1). This protocol is out of date and does not support modern cryptographic algorithms and as a result, many browsers no longer support TLS 1.1.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

TLS Connection: TLS Version 1.2 Not Enabled — Trivial

Solution Details

Consider only supporting newer protocols such as TLSv1.2 and TLSv1.3. Consult your specific vendor documentation for more information.

Vulnerability Details

This host appears to not support Transport Layer Security version 1.2 (TLSv1.2). This protocol is necessary to use modern cryptographic algorithms.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Web Server Default Error Page Detected — Trivial

Vulnerability Details

This asset is running a web server service which is configured to use default error responses.
Impact:
A remote attacker may be able to leverage these default error responses to gather information about this asset.

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Solution Details

Refer to the documentation for your web server regarding using custom error pages.

CVSS Base Score: 0

Web Server Directory Structure Disclosure — Trivial

False Positive Notes

This item is not likely to be a false positive. Please validate and document remediation efforts through Active View.

Vulnerability Details

This host's web application discloses information that details the directory structure of the underlying host OS. This type of information is typically disclosed in verbose error messages or in file links which utilize fully qualified paths instead of relative paths. Attackers can use this type of information to hone more specific attacks against the web application or the underlying host OS.

Solution Details

Ensure that verbose error messages are disabled and that all references to files within the web application are relative paths.
