FORTRA®

Single Sign On (SSO) Managed Services

Managing user passwords involves unnecessary cost, risk, and lost productivity for most organizations. Yet many IT departments have given up hope of achieving single sign-on due to its complexity and perceived cost.

SSO doesn't have to be expensive or time-consuming, especially if your network includes a Windows domain along with applications running on IBM i (AS/400).

Single Sign On Managed Services eliminates up to 80 percent of your password management costs within 24 hours – using technology you already own—with positive ROI typically achieved in four to twelve months. This is the value of single sign on at its best.

Quick Results, Faster ROI

Unlike most IT projects, the positive impact of SSO is immediately evident across the enterprise upon implementation. End users no longer have to log in to applications they use every day, the number of help desk calls drops, and password-related distractions decline. The best part is that most organizations achieve positive ROI within four to twelve months, and the savings continue year after year.

Guided by an SSO expert, your technical staff can bypass the upfront learning curve for SSO:

- Reduce password-related distractions across the enterprise
- Relieve your help desk from the majority of its current password burden
- Eliminate the SSO learning curve for IT
- Ensure ongoing SSO success with responsive, expert support
- Achieve positive ROI within 4–12 months

Eliminate Password Problems

For most organizations, the majority of password problems occur when users attempt to log on to services from their PCs. The Single Sign On Managed Service quickly eliminates password inefficiencies between Windows and your IBM i systems. Depending on your IT environment and applications, this cost-effective service can eliminate up to 80 percent or more of your password management costs.

PRODUCT SUMMARY

What you get:

1. SSO implementation between Windows-based workstations and IBM i systems.

2. Hands-on implementation training with an experienced SSO expert.

3. On-going tech support to proactively address issues introduced by application or OS updates as well as changes in your environment. Achieve positive ROI within the first 12 months.

SSO Without the Learning Curve

Avoid the long and complex SSO learning curve. Our experts teach your system administrator the SSO concepts necessary for your environment, guide them through each of the configuration steps to implement all of your current users, and train them to implement new users.

Users and help desk staff will experience the difference immediately upon implementation.

No New Software Required

If your IT network includes a Windows domain, you may already be using and managing the software you need to implement SSO for many of your systems and applications. Most IT professionals just need experienced guidance on how to configure the complex software on non-Windows systems in their specific environment.

SSO for Cloud-Based Windows Environments

If you organization is currently on or switching to a cloud-based Windows environment fulfilled by the Azure cloud computing platform, our SSO services help you make the most of your investment in the cloud. Fortra offers a deployment of IBM i SSO that contains all of the same benefits as the on-premises solution while allowing organizations to fully leverage the Azure infrastructure and avoid maintaining any on-premises domain controllers.

Risk-Free Implementation

Our approach to SSO does not require system outages and our experts will guide your staff through the implementation. Once we configure your non-Windows systems, you can then enable all your users, a few users, or a single user to test the results. You can also disable users from using SSO at any time. You maintain full control.

Get Started with Single Sign-On

Contact us to set up a free SSO consultation. We'll discuss your current setup and how Fortra can help you reach your goals.
